**Data Validator/Group Leader:**

Heather Joy      15-SEP-11

# **GC Semivolatile PCB Analysis**

**PCB Case Narrative**  
**Ecology and Environment, Inc. Start-3 002233.2008 (ECOL)**  
**SDG 284538**

**Method/Analysis Information**

**Procedure:** Analysis of Polychlorinated Biphenyls by ECD

Analytical Method: SW846 3535A/8082A

Prep Method: SW846 3535A

Analytical Batch Number: 1136663

Prep Batch Number: 1136662

**Sample Analysis**

The following samples were analyzed using the analytical protocol as established in SW846 3535A/8082A:

| <b>Sample ID</b> | <b>Client ID</b>                                 |
|------------------|--|
| 284538001        | 11080101   |
| 1202475427       | Method Blank (MB)                                |
| 1202475428       | Laboratory Control Sample (LCS)                  |
| 1202475429       | 284538001(11080101) Matrix Spike (MS)            |
| 1202475430       | 284538001(11080101) Matrix Spike Duplicate (MSD) |

The samples in this SDG were analyzed on an "as received" basis.

**Preparation/Analytical Method Verification**

**SOP Reference**

Procedure for preparation, analysis and reporting of analytical data are controlled by GEL Laboratories LLC as Standard Operating Procedure (SOP). The data discussed in this narrative has been analyzed in accordance with GL-OA-E-040 REV# 16.

Raw data reports are processed and reviewed by the analyst using the Target software package. False positives have been removed from the Target quantitation reports per standard operating procedures (SOP) section 23.0.

**Calibration Information**

Please note that the 'Cal Date' indicated on each quantitation report reflects the date and time of the most recent calibrated analyte(s) in the Target processing method. Since the laboratory may calibrate with multiple solutions on different days using the same processing method, the Target software will update the 'Cal Date' to the last calibration file, date and time. The correct dates and times for all calibration files are located on the Calibration History report in the Standard Data section in the data package.

Due to software limitations, the Calibration Summary Form 6 may not indicate all the calibration files comprising the initial calibration. A complete list of the initial calibration data files are shown in the Calibration History report located in the Standard Data section of the data package.

**Initial Calibration**

All initial calibration requirements have been met for this sample delivery group (SDG).

The linear equation used in Target and indicated on the initial calibration summary form is not a conventional linear equation (slope intercept formula) and does not match the equation found in SW-846 method 8000B. The x and y axes are inversed in Target, so that the instrument response is treated as the independent variable (x) and the concentration ratio is treated as the dependent variable (y). The equation used in Target to calculate sample results is adjusted to account for the linear equation inversion and reciprocal slope. The adjusted calculation has been independently verified to produce valid results.

**Continuing Calibration Verification (CCV) Requirements**

All associated calibration verification standard(s) (ICV or CCV) met the acceptance criteria. All analytes were within the established retention time windows for this method.

**Quality Control (QC) Information****Method Blank (MB) Statement**

The MB analyzed with this SDG did not meet the acceptance criteria. The MB was contaminated with Aroclor-1242, Aroclor-1254 and Aroclor-1260 during sample preparation. This non-compliance had no adverse effects on the data as the associated ECOL sample was not detected with any Aroclors. See DER #991280 in the Miscellaneous Data section.

**Surrogate Recoveries**

Samples 1202475429 (11080101MS), 1202475430 (11080101MSD) and 284538001 (11080101) failed to meet acceptance criteria for surrogate recovery due to sample matrix interference as the MS, MSD and the parent sample failed surrogate recovery in the same manner. See DER #991280 in the Miscellaneous Data section.

**Laboratory Control Sample (LCS) Recovery**

The LCS spike recoveries met the acceptance limits.

**QC Sample Designation**

Sample 284538001 (11080101) was selected for the matrix spike and matrix spike duplicate analysis.

**Matrix Spike (MS) Recovery Statement**

The MS recovery for this SDG was not within the established acceptance limits due to sample matrix interference. See DER #992128 in the Miscellaneous Data section.

**Matrix Spike Duplicate (MSD) Recovery Statement**

The MSD recovery for this SDG was not within the established acceptance limits due to sample matrix interference. See DER #991280 in the Miscellaneous Data section.

**MS/MSD Relative Percent Difference (RPD) Statement**

The RPD between the MS and MSD met the acceptance limits.

**Technical Information****Holding Time Specifications**

GEL assigns holding times based on the associated methodology, which assigns the date and time from sample collection of sample receipt. Those holding times expressed in hours are calculated in the AlphaLIMS system. Those holding times expressed as days expire at midnight on the day of expiration. All samples in this SDG met the specified holding time.

**Preparation/Analytical Method Verification**

All procedures were performed as stated in the SOP. All reported analyte detections in client and quality control samples were within the established retention time windows. Reported analyte concentrations were confirmed on dissimilar columns.

**Sample Dilutions**

The samples in this SDG did not require dilutions.

**Sample Re-extraction/Re-analysis**

Re-extractions or re-analyses were not required in this SDG.

**Miscellaneous Information****Electronic Package Comment**

The following package was generated using an electronic data processing program referred to as "virtual packaging". In an effort to increase quality and efficiency, the laboratory is developing systems to eventually generate all data packages electronically. The following change from "traditional" packages should be noted:

Analyst/peer reviewer initials and dates are not present on the electronic data files. Presently, all initials and dates are present on the original raw data. These hard copies are temporarily stored in the laboratory. An electronic signature page inserted after the case narrative of each electronic package will indicate the analyst, reviewer, and report specialist names associated with the generation of the data and package. The data validator will always sign and date the case narrative. Data that are not generated electronically, such as hand written pages, will be scanned and inserted into the electronic package.

**Data Exception (DER) Documentation**

Data Exception Report (DER) is for documentation of any procedural anomalies that may deviate from referenced SOP or contractual document. DER #991280 was generated for this batch. A copy is included in the Miscellaneous Data section of this package.

**Manual Integrations**

Certain standards and samples may have required manual integration to correctly position the baseline as set in the calibration standard injections. If manual integration was performed, copies of all manual integration peak profiles are included in the raw data section of this PCB fraction.

**Additional Comments**

The additional comments field is used to address special issues associated with each analysis, clarify method/contractual issues pertaining to the analysis, and to list any report documents generated as a result of sample analysis or review. The following additional comments were required:

The higher results from either column have been chosen and reported in the data package for the client samples, MB and LCS. The data reported for the MS and MSD are from the same analytical column as the parent sample.

The data reported on the form I and III may differ slightly from the data reported on the form X. This is due to software limitations in rounding differences between the forms.

Aroclors quantitated on the raw data report by the Target data system do not necessarily represent positive Aroclor identification. In order for positive identification to be made, the Aroclor must match in pattern and retention time; as well as quantitate relatively close between the primary and confirmation columns, as specified in SW846 method 8000. When these conditions are not met, the Aroclor is reported as a non-

detect on the data report. These situations will be noted on the raw data as DMP, representing does not match pattern, or DNC does not confirm.

#### **System Configuration**

The Semi-Volatiles-PCB analysis was performed on the following instrument configuration:

| <b>Instrument ID</b> | <b>Instrument</b>   | <b>System Configuration</b> | <b>Column ID</b> | <b>Column Description</b>                 |
|----------------------|---|-----------------------------|------------------|---|
| ECD8A.I_1            | Agilent 6890 Gas Chromatograph/Dual ECD w/ 7683 Autosampler | HP6890 Series ECD           | Rtx-CLP I        | 30m x 0.25mm, 0.25um (Rtx-CLPesticide I)  |
| ECD8A.I_2            | Agilent 6890 Gas Chromatograph/Dual ECD w/ 7683 Autosampler | HP6890 Series ECD           | Rtx-CLP II       | 30m x 0.25mm, 0.20um (Rtx-CLPesticide II) |

#### **Certification Statement**

Where the analytical method has been performed under NELAP certification, the analysis has met all of the requirements of the NELAC standard unless otherwise noted in the analytical case narrative.

**Review Validation**

GEL requires all analytical data to be verified by a qualified data validator. In addition, all data designated for CLP or CLP-like packaging will receive a third level validation upon completion of the data package.

The following data validator verified the information presented in this case narrative:

**Preparation/Analytical Method Verification**

The SOP stated above has been prepared based on technical research and testing conducted by GEL Laboratories, LLC. and with guidance from the regulatory documents listed in this "Method/Analysis Information" section.

## **System Configuration**

The Metals analysis - ICPMS was performed on a Perkin Elmer ELAN 9000 inductively coupled plasma mass spectrometer (ICP-MS). The instrument is equipped with a cross-flow nebulizer, quadrupole mass spectrometer, and dual mode electron multiplier detector. Internal standards of scandium, germanium, indium, tantalum, and/or lutetium were utilized to cover the mass spectrum. Operating conditions are set at 1400W power and combined argon pressures of 360+/-7 kPa for the plasma and auxiliary gases, and 0.85 L/min carrier gas flow, and an initial lens voltage of 5.2.

The Metals analysis-Mercury was performed on a Perkin-Elmer Flow Injection Mercury System (FIMS-100) automated mercury analyzer. The instrument consists of a cold vapor atomic absorption spectrometer set to detect mercury at a wavelength of 253.7 nm. Sample introduction through the flow injection system is performed via a peristaltic pump at 9 mL/min and nitrogen carrier gas rate of 80 mL/min.

## **Calibration Information**

### **Instrument Calibration**

All initial calibration requirements have been met for this sample delivery group (SDG).

### **CRDL Requirements**

All CRDL standard(s) met the referenced advisory control limits.

### **ICSA/ICSAB Statement**

All interference check samples (ICSA and ICSAB) associated with this SDG met the established acceptance criteria.

### **Continuing Calibration Blank (CCB) Requirements**

All continuing calibration blanks (CCB) bracketing this batch met the established acceptance criteria.

### **Continuing Calibration Verification (CCV) Requirements**

All continuing calibration verifications (CCV) bracketing this SDG met the acceptance criteria.

## **Quality Control (QC) Information**

### **Method Blank (MB) Statement**

The MBs analyzed with this SDG met the acceptance criteria.

### **Laboratory Control Sample (LCS) Recovery**

The LCS spike recoveries met the acceptance limits.

### **Quality Control (QC) Sample Statement**

The following sample was selected as the quality control (QC) sample for this SDG:

284538001 (11080101).

**Matrix Spike (MS) Recovery Statement**

The percent recoveries (%R) obtained from the MS analyses are evaluated when the sample concentration is less than four times (4X) the spike concentration added. All applicable elements met the acceptance criteria.

**Matrix Spike Duplicate (MSD) Recovery Statement**

The percent recovery (%R) obtained from the MSD analyses are evaluated when the sample concentration is less than four times (4X) the spike concentration added. All applicable elements met the acceptance criteria.

**MS/MSD Relative Percent Difference (RPD) Statement**

The RPD(s) between the MS and MSD met the acceptance limits.

**Serial Dilution % Difference Statement**

The serial dilution is used to assess matrix suppression or enhancement. Raw element concentrations that are 25X the IDL/MDL for CVAA, 50X the IDL/MDL for ICP, and 100X the IDL/MDL for ICP-MS analyses are applicable for serial dilution assessment. All applicable analytes met the acceptance criteria of less than 10% difference (%D).

**Duplicate Relative Percent Difference (RPD) Statement**

The RPD obtained from the designated sample duplicate (DUP) is evaluated based on acceptance criteria of 20% when the sample is >5X the contract required detection limit (RL). In cases where either the sample or duplicate value is less than 5X the RL, a control of +/-RL is used to evaluate the DUP results. All applicable analytes met these requirements.

**Technical Information**

**Holding Time Specifications**

GEL assigns holding times based on the associated methodology, which assigns the date and time from sample collection of sample receipt. Those holding times expressed in hours are calculated in the AlphaLIMS system. Those holding times expressed as days expire at midnight on the day of expiration. All samples in this SDG met the specified holding time.

**Preparation/Analytical Method Verification**

All procedures were performed as stated in the SOP.

**Sample Dilutions**

Dilutions are performed to minimize matrix interferences resulting from elevated mineral element concentrations present in solid samples and/or to bring over range target analyte concentrations into the linear calibration range of the instrument. The samples in this SDG did not require dilutions.

**Preparation Information**

The samples in this SDG were prepared exactly according to the cited SOP.

**Miscellaneous Information****Electronic Packaging Comment**

This data package was generated using an electronic data processing program referred to as virtual packaging. In an effort to increase quality and efficiency, the laboratory has developed systems to generate all data packages electronically. The following change from traditional packages should be noted:

Analyst/peer reviewer initials and dates are not present on the electronic data files. Presently, all initials and dates are present on the original raw data. These hard copies are temporarily stored in the laboratory. The data validator will always sign and date the case narrative. Data that are not generated electronically, such as hand written pages, will be scanned and inserted into the electronic package.

**Data Exception (DER) Documentation**

Data exception reports (DERs) are generated to document procedural anomalies that may deviate from referenced SOP or contractual documents. A data exception report (DER) was not generated for this SDG.

**Additional Comments**

Additional comments were not required for this SDG.

**Certification Statement**

Where the analytical method has been performed under NELAP certification, the analysis has met all of the requirements of the NELAC standard unless otherwise noted in the analytical case narrative.

**Review Validation:**

GEL requires all analytical data to be verified by a qualified data validator. In addition, all data designated for CLP or CLP-like packaging will receive a third level validation upon completion of the data package.

**The following data validator verified the information presented in this case narrative:**

### Certificate of Analysis Report for

ECOL008 Ecology and Environment, Inc. Start-3 002233.2008

Client SDG: 284538 GEL Work Order: 284538

**The Qualifiers in this report are defined as follows:**

- \* A quality control analyte recovery is outside of specified acceptance criteria
- \*\* Analyte is a surrogate compound
- B For General Chemistry and Organic analysis the target analyte was detected in the associated blank.
- B Metals--Either presence of analyte detected in the associated blank, or MDL/IDL < sample value < PQL
- E Organics--Concentration of the target analyte exceeds the instrument calibration range
- J Value is estimated
- P Organics--The concentrations between the primary and confirmation columns/detectors is >40% different. For HPLC, difference is also <70%
- U Analyte was analyzed for, but not detected above the MDL, MDA, or LOD.

Where the analytical method has been performed under NELAP certification, the analysis has met all of the requirements of the NELAC standard unless qualified on the Certificate of Analysis.

The designation ND, if present, appears in the result column when the analyte concentration is not detected above the RL or LOQ.

This data report has been prepared and reviewed in accordance with GEL Laboratories LLC standard operating procedures. Please direct any questions to your Project Manager, Jake Crook.

## ICPMS #7 Daily Performance Report

### Sample ID: Sample

Sample Date/Time: Wednesday, August 24, 2011 10:01:15

Sample Description:

Method File: C:\elandata\Method\daily2.mth

Dataset File: C:\elandata\Dataset\default\Sample.3517

Tuning File: C:\elandata\Tuning\default2.tun

Optimization File: C:\elandata\Optimize\Default.dac

Dual Detector Mode: Pulse

Acq. Dead Time(ns): 80

Current Dead Time (ns): 80

### Summary

| Analyte | Mass  | Meas. Intens. Mean | Net Intens. Mean | Net Intens. SD | Net Intens. RSD |
|---------|-------|--------------------|------------------|----------------|-----------------|

## ICPMS#7 - Summary Report

Sample ID: Blank

Sample Date/Time: Thursday, August 25, 2011 06:17:27

Sample Type: Sample

Sample Description:

Number of Replicates: 3

Batch ID:

Method File: C:\elandata\Method\6020a.mth

Dataset File: C:\Elandata\DataSet\110824\Blank.204

### Concentration Results

| Analyte | Mass | Conc. Mean | Report Unit | Conc. RSD | Meas. Intens. Mean | Net Intens. Mean |

## ICPMS#7 - Summary Report

Sample ID: Standard 1

Sample Date/Time: Thursday, August 25, 2011 06:25:46

Sample Type: Sample

Sample Description:

Number of Replicates: 3

Batch ID:

Method File: C:\elandata\Method\6020a.mth

Dataset File: C:\Elandata\DataSet\110824\Standard 1.205

## ICPMS#7 - Summary Report

Sample ID: 1202472433

Sample Date/Time: Thursday, August 25, 2011 08:05:37

Sample Type: Sample

Sample Description: ECOL 0520 MB

Number of Replicates: 3

Batch ID: 1135453|1|prb

Method File: C:\elandata\Method\6020a.mth

Dataset File: C:\Elandata\DataSet\110824\1202472433.217

### Concentration Results

## ICPMS#7 - Summary Report

Sample ID: 284538001

Sample Date/Time: Thursday, August 25, 2011 08:39:52

Sample Type: Sample

Sample Description: ECOL 0520

Number of Replicates: 3

Batch ID: 1135453|1|prb

Method File: C:\elandata\Method\6020a.mth

Dataset File: C:\Elandata\DataSet\110824\284538001.221

## ICPMS #7 Daily Performance Report

### Sample ID: Sample

Sample Date/Time: Monday, August 29, 2011 10:31:00

### Sample Description:

Method File: C:\elandata\Method\daily2.mth

Dataset File: C:\elandata\Dataset\default\Sample.3611

Tuning File: C:\elandata\Tuning\default2.tun

Optimization File: C:\elandata\Optimize\Default.dac

Dual Detector Mode: Pulse

Acq. Dead Time(ns): 80

Current Dead Time (ns): 80

### Summary

| Analyte | Mass  | Meas. Intens. Mean | Net Intens. Mean | Net Intens. SD | Net Intens. RSD |

### Certificate of Analysis Report for

ECOL008 Ecology and Environment, Inc. Start-3 002233.2008

Client SDG: 284538 GEL Work Order: 284538

**The Qualifiers in this report are defined as follows:**

- \* A quality control analyte recovery is outside of specified acceptance criteria
- \*\* Analyte is a surrogate compound
- B For General Chemistry and Organic analysis the target analyte was detected in the associated blank.
- E Organics—Concentration of the target analyte exceeds the instrument calibration range
- J Value is estimated
- P Organics—The concentrations between the primary and confirmation columns/detectors is >40% different. For HPLC, difference is also <70%
- U Analyte was analyzed for, but not detected above the MDL, MDA, or LOD.

Where the analytical method has been performed under NELAP certification, the analysis has met all of the requirements of the NELAC standard unless qualified on the Certificate of Analysis.

The designation ND, if present, appears in the result column when the analyte concentration is not detected above the detection limit.

This data report has been prepared and reviewed in accordance with GEL Laboratories LLC standard operating procedures. Please direct any questions to your Project Manager, Jake Crook.

## Certificate of Analysis

Report Date: September 7, 2011

Company : US EPA Equipment Warehouse  
Address : 1620 S. 92nd Place, Unit B

Seattle, Washington 98108  
Contact: Mr. Steve Hall  
Project: Project No. 002233.0599.01SF

Client Sample ID: 11080106 Project: ECOL00111  
Sample ID: 284538002 Client ID: ECOL008

## Certificate of Analysis

Report Date: September 7, 2011

Company : US EPA Equipment Warehouse  
Address : 1620 S. 92nd Place, Unit B

Seattle, Washington 98108  
Contact: Mr. Steve Hall  
Project: Project No. 002233.0599.01SF

Client Sample ID: 11080106 Project: ECOL00111  
Sample ID: 284538002 Client ID: ECOL008

| Parameter | Qualifier | Result | DL | RL | Units | DF | Analyst | Date | Time | Batch | Method |
|-----------|-----------|--------|----|----|-------|----|---------|------|------|-------|--------|
|-----------|-----------|--------|----|----|-------|----|---------|------|------|-------|--------|

The following Analytical Methods were performed:

| Method | Description | Analyst Comments |
|--------|-------------|------------------|
| 1      | SW846 8260B |                  |
| 2      | SW846 8260B |                  |

| Surrogate/Tracer Recovery | Test                                       | Result    | Nominal | Recovery% | Acceptable Limits |
|---------------------------|--|-----------|---------|-----------|-------------------|
| 1,2-Dichloroethane-d4     | GEL 8260B Method List Liquid "As Received" | 44.8 ug/L | 50.0    | 89.5      | (79%-124%)        |
| Bromofluorobenzene        | GEL 8260B Method List Liquid "As Received" | 50.5 ug/L | 50.0    | 101       | (80%-120%)        |
| Toluene-d8                | GEL 8260B Method List Liquid "As Received" | 48.1 ug/L | 50.0    | 96.2      | (80%-120%)        |
| 1,2-Dichloroethane-d4     | GEL 8260B Method List Liquid "As Received" | 235 ug/L  | 50.0    | 93.9      | (79%-124%)        |
| Bromofluorobenzene        | GEL 8260B Method List Liquid "As Received" | 252 ug/L  | 50.0    | 101       | (80%-120%)        |
| Toluene-d8                | GEL 8260B Method List Liquid "As Received" | 240 ug/L  | 50.0    | 96.2      | (80%-120%)        |

### Notes:

The Qualifiers in this report are defined as follows:

- \*\* Analyte is a surrogate compound
- < Result is less than value reported
- > Result is greater than value reported
- A The TIC is a suspected aldol-condensation product
- B For General Chemistry and Organic analysis the target analyte was detected in the associated blank.
- C Analyte has been confirmed by GC/MS analysis
- D Results are reported from a diluted aliquot of the sample
- E Metals--%difference of sample and SD is >10%. Sample concentration must meet flagging criteria
- E Organics--Concentration of the target analyte exceeds the instrument calibration range
- F Estimated Value
- FB Mercury was found present at quantifiable concentrations in field blanks received with these samples. Data associated with the blank are deemed invalid for reporting to regulatory agencies
- H Analytical holding time was exceeded
- J Value is estimated
- JNX Non Calibrated Compound
- M Matrix Related Failure
- N Metals--The Matrix spike sample recovery is not within specified control limits
- N Organics--Presumptive evidence based on mass spectral library search to make a tentative identification of the analyte (TIC). Quantitation is based on nearest internal standard response factor
- N/A RPD or %Recovery limits do not apply.
- ND Analyte concentration is not detected above the detection limit

## QC Summary

Workorder: 284538

Page 16 of 16

| Parmname | NOM  | Sample | Qual | QC | Units | RPD% | REC% | Range | Anlst | Date | Time |
|----------|--|--------|------|----|-------|------|------|-------|-------|------|------|
| NJ       | Consult Case Narrative, Data Summary package, or Project Manager concerning this qualifier   |        |      |    |       |      |      |       |       |      |      |
| P        | Organics--The concentrations between the primary and confirmation columns/detectors is >40% different. For HPLC, difference is also <70% |        |      |    |       |      |      |       |       |      |      |
| Q        | One or more quality control criteria have not been met. Refer to the applicable narrative or DER.  |        |      |    |       |      |      |       |       |      |      |
| R        | Sample results are rejected  |        |      |    |       |      |      |       |       |      |      |
| U        | Analyte was analyzed for, but not detected above the MDL, MDA, or LOD.   |        |      |    |       |      |      |       |       |      |      |
| UJ       | Compound cannot be extracted   |        |      |    |       |      |      |       |       |      |      |
| X        | Consult Case Narrative, Data Summary package, or Project Manager concerning this qualifier   |        |      |    |       |      |      |       |       |      |      |
| Y        | QC Samples were not spiked with this compound  |        |      |    |       |      |      |       |       |      |      |
| ^        | RPD of sample and duplicate evaluated using +/-RL. Concentrations are <5X the RL. Qualifier Not Applicable for Radiochemistry.           |        |      |    |       |      |      |       |       |      |      |
| h        | Preparation or preservation holding time was exceeded  |        |      |    |       |      |      |       |       |      |      |

N/A indicates that spike recovery limits do not apply when sample concentration exceeds spike conc. by a factor of 4 or more.

^ The Relative Percent Difference (RPD) obtained from the sample duplicate (DUP) is evaluated against the acceptance criteria when the sample is greater than five times (5X) the contract required detection limit (RL). In cases where either the sample or duplicate value is less than 5X the RL, a control limit of +/- the RL is used to evaluate the DUP result.

\* Indicates that a Quality Control parameter was not within specifications.

For PS, PSD, and SDILT results, the values listed are the measured amounts, not final concentrations.

Where the analytical method has been performed under NELAP certification, the analysis has met all of the requirements of the NELAC standard unless qualified on the QC Summary.

**Potentially affected work order(s)(SDG): 284538**

**Application Issues:**

Failed Recovery for MS/PS

Failed Recovery for MSD/PSD

**Specification and Requirements  
Exception Description:**

1. The recoveries for 2-Chloroethylvinyl ether were below acceptance limits for 1202477758(11080101) (MS) and 1202477759(11080101) (MSD).

2-Chloroethylvinyl ether: MS, 0.0%; MSD, 0.0%; limits, 52.0%–125.0%

**DER Disposition:**

1. Preservation by acidification causes degradation of 2-Chloroethylvinyl ether, resulting in the low recoveries observed in these samples.

## TOXICITY TEST REPORT

## TEST IDENTIFICATION

Test No.: 826-1

Title: Toxicity of freshwater sediments collected from Kitsap County, WA using a 28-day amphipod, *Hyalella azteca*, sediment bioassay as part of Project No. 002233.0599.01SF, TDD No. 10-08-0011.

Protocol No.: NAS-XXX-HA4c, February 11, 2000. Revision 3 (4-26-05). Based on ASTM 2001 (Standard test methods for measuring the toxicity of sediment-associated contaminants with fresh water invertebrates, E1706-00), Am. Soc. Test. Mat., Phila., PA, and EPA Method 100.1 (Methods for measuring the toxicity and bioaccumulation of sediment-associated contaminants with freshwater invertebrates, EPA/600/R-99/064).

## STUDY MANAGEMENT

Study Sponsor: Ecology and Environment, Inc., 720 Third Ave., Suite 1700, Seattle, WA 98104

Sponsor's Study Monitor: Mr. Mark Woodke

Testing Laboratory: Northwestern Aquatic Sciences, P.O. Box 1437, Newport, OR 97365

Test Location: Newport laboratory

Laboratory's Study Personnel: G.J. Irissarri, B.S., Proj. Man./Study Dir.; L.K. Nemeth, B.A., M.B.A., QA Officer; R.S. Caldwell, PhD, Sr. Aq. Toxicologist; G.A. Buhler, B.S., Aq. Toxicologist; L.P. Sandoval, B.S., Tech.; Y. Nakahama, Tech., B. Hurst, M.S., Tech.

Study Schedule:

Test Beginning: 8-26-11, 1005 hrs.

Test Ending: 9-23-11, 0930 hrs.

Disposition of Study Records: All raw data, reports and other study records are stored at Northwestern Aquatic Sciences, 3814 Yaquina Bay Rd., Newport, OR 97365.

Statement of Quality Assurance: The test data were reviewed by the Quality Assurance Unit to assure that the study was performed in accordance with the protocol and standard operating procedures. This report is an accurate reflection of the raw data.

## TEST MATERIAL

Test Sediments: Freshwater test sediments collected from Kitsap County, WA. as part of Project No. 002233.0599.01SF, TDD No. 10-08-0011. Details are as follows:

|                 |          |          |          |          |
|-----------------|----------|----------|----------|----------|
| NAS Sample No.  | 3838G    | 3839G    | 3840G    | 3841G    |
| Description     | 11070001 | 11070002 | 11070003 | 11070004 |
| Collection Date | 7/27/11  | 7/27/11  | 7/27/11  | 7/27/11  |
| Receipt Date    | 8/14/11  | 8/24/11  | 8/24/11  | 8/24/11  |

Control Sediment: The negative control sediment (NAS#3820G) was collected on 8-14-11 from an area approximately one mile east of the Hwy. 101 bridge at Beaver Creek, approx. 8 miles south of Newport, OR.

Treatments: Homogenized at test set up by mixing using stainless steel implements.

Storage: All test and control sediments were stored at 4°C in the dark in sealed containers until used.

## TEST WATER

Source: Dechlorinated municipal tap water.

Date of Preparation: Four batches of test water were collected on: 8/17/11, 8/25/11, 8/26/11, 9/7/11.

Water Quality (mean  $\pm$  S.D.):

pH:  $7.5 \pm 0.1$  (n=4)

conductivity:  $141 \pm 4$   $\mu$ mhos/cm (n=4)

hardness:  $43 \pm 0$  mg/L as CaCO<sub>3</sub> (n=4)

alkalinity:  $30 \pm 0$  mg/L as CaCO<sub>3</sub>. (n=4)

total chlorine: All batches were  $< 0.02$  mg/L (n=4)

Pretreatment: Dechlorinated and aerated  $\geq 24$  hr.

## TEST ORGANISMS

Species: *Hyalomma azteca*, amphipod.

Age/Size: 7-8 days old

Source: Chesapeake Cultures, Hayes, VA; received 8-24-11

Acclimation: Holding conditions for the three days prior to testing averaged: Temperature,  $22.9 \pm 0.3$  °C; dissolved oxygen,  $10.3 \pm 4.1$  mg/L; pH,  $7.7 \pm 0.7$ ; conductivity,  $351 \pm 115$  µmhos/cm; hardness,  $137 \pm 54$  mg/L as CaCO<sub>3</sub>; and alkalinity,  $120 \pm 46$  mg/L as CaCO<sub>3</sub>. Photoperiod, 16:8, L:D. Half of the water was replaced daily with dechlorinated municipal tap water during holding. Animals were fed YTC daily during holding.

## TEST PROCEDURES AND CONDITIONS

The following is an abbreviated statement of the test procedures and a statement of the test conditions actually employed. See the test protocol (Appendix I) for a more detailed description of the test procedures used in this study.

Test Chambers: 300 ml high-form glass beakers

Test Volumes: 100 ml sediment layer; 175 ml test water.

Replicates/Treatment: 8

Organisms/Treatment: 80

Water Volume Changes: 2 water volumes per day

Aeration: None.

Feeding: Animals are fed 1.0 ml of YTC suspension per beaker daily.

Effects Criteria: 1) survival after 28 days, and 2) average individual dry weight after 28 days. Death is defined as no visible movement or response to tactile stimulation. Missing organisms were considered to be dead.

Water Quality and Other Test Conditions: The temperature, dissolved oxygen, conductivity, pH, hardness, alkalinity, and ammonia-nitrogen were measured in the overlying water of one replicate test container per treatment on days 0 and 28 of the test. Temperature was measured daily, pH and dissolved oxygen three times per week, and conductivity weekly, in the overlying water of one replicate test container per treatment. Hardness and alkalinity were measured with titrimetric methods. Ammonia-N was measured using Hach reagents based on the salicylate (Clin. Chim. Acta 14:403, 1996) colorimetric method; samples were not distilled prior to analysis. The photoperiod was 16:8, L:D.

## DATA ANALYSIS METHODS

Survival, mortality and average individual dry weight were calculated for each replicate as follows:

percent survival =  $100 \times (\text{number surviving} / \text{initial number tested})$

percent mortality =  $100 \times (\text{number dead} / \text{initial number tested})$

average individual dry weight =  $(\text{final wt.} - \text{tare wt.}) / \text{number weighed}$ ,

where:

final wt. = tare wt. + dry weight of organisms recovered on day 28, in mg

Means and standard deviations for the biological endpoints described above, and for water quality data, were computed using Microsoft Excel 2000.

## PROTOCOL DEVIATIONS

None

## REFERENCE TOXICANT TEST

The reference toxicant test is a multi-concentration toxicity test using potassium chloride, to evaluate the performance of the test organisms used in the sediment toxicity test. The performance is evaluated by comparing the results of this test with historical results obtained at the laboratory. A summary of the reference toxicant test result is given below. The reference toxicant test raw data are found in Appendix III.

Test No.: 999-2930

Reference Toxicant and Source: Potassium Chloride (KCl), Fisher Lot #073280.

Test Date: 8-26-11.

Dilution Water Used: Moderately hard synthetic water prepared from Milli-Q® deionized water.

Result: 96-hr LC50, 0.45 g/L. This result is within the laboratory's control chart warning limits (0.31 – 0.47 g/L).

## TEST RESULTS

Observations of water quality in the overlying water throughout the test are summarized in Table 1. A detailed tabulation of the water quality results by sample and test day can be found in Appendix II. The means and standard deviations of percent mortality and average dry weight of *Hyaella* exposed for 28 days to sediments are summarized in Tables 2 and 3. Detailed data organized by sample and replicate, and summary statistics for these observations, are given in Appendix II.

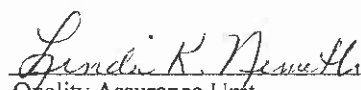

Except as noted above, all other water quality observations of overlying water temperature and dissolved oxygen were within the protocol specified ranges. Ammonia-N in the overlying water ranged between <0.1 and 0.2 mg/L for all day 0 and day 28 measurements.

The test met the survival and weight acceptability criteria specified in the test protocol with 5.0% mean control mortality ( $\leq 20\%$  required) and a control individual mean dry weight of 0.50 mg per amphipod. The reference toxicant (positive control) LC50 result was within the laboratory's control chart limits (0.41 g/L; control chart mean  $\pm 2$  S.D. =  $0.39 \pm 0.08$ ). It is concluded, therefore, that the test has developed fully acceptable data for use in making management decisions.

The percent mortality of all test sediments was not significantly greater than that of the control. The average individual biomass of test sediments 11070002 and 11070004 was significantly less than that of the control at the 0.05 level of significance.

## **APPENDIX I**

## **PROTOCOL**

## TEST PROTOCOL

### FRESHWATER AMPHIPOD, *HYALELLA AZTECA*, 28-DAY SEDIMENT SURVIVAL AND GROWTH TEST

#### 1. INTRODUCTION

1.1 Purpose of Study: The purpose of this study is to characterize the chronic toxicity of freshwater sediments using a 28-day exposure and survival and growth endpoints with the amphipod, *Hyaella azteca*.

1.2 Referenced Method: This protocol is based on ASTM Method E 1706-00 (ASTM 2001) and EPA Method 100.1 (EPA/600/R-99/064)

1.3 Summary of Method: A summary of test conditions for the amphipod 28-day sediment survival and growth test is tabulated below. The test with *Hyaella azteca* is conducted at  $23 \pm 1^\circ\text{C}$  with a 16L:8D photoperiod at an illuminance of about 100-1000 lux. Test chambers are 300-mL high-form lipless beakers containing 100 mL of sediment and 175 mL of overlying water. Ten 7-8day old amphipods are used in each replicate. The number of replicates/treatment depends on the objective of the test. Eight replicates are recommended for routine testing. Amphipods in each test chamber are fed 1.0 mL of YCT food daily. Each chamber receives two volume additions per day of overlying water. Test endpoints include survival and growth.

#### 2. STUDY MANAGEMENT

2.1 Sponsor's Name and Address:

---

---

---

---

2.2 Sponsor's Study Monitor:

---

2.3 Name of Testing Laboratory:

Northwestern Aquatic Sciences  
3814 Yaquina Bay Road, P.O. Box 1437  
Newport, OR 97365.

2.4 Test Location:

---

2.5 Laboratory's Personnel to be Assigned to the Study:

Study Director: \_\_\_\_\_  
Quality Assurance Unit: \_\_\_\_\_  
Aquatic Toxicologist: \_\_\_\_\_  
Aquatic Toxicologist: \_\_\_\_\_

2.6 Proposed Testing Schedule: Tests are normally begun within 14 days of sample collection. Reference toxicant test to be run concurrently.

2.7 Good Laboratory Practices: The test is conducted following the principles of Good Laboratory Practices (GLP) as defined in the EPA/TSCA Good Laboratory Practice regulations revised August 17, 1989 (40 CFR Part 792).

### 3. TEST MATERIAL

The test materials are freshwater sediments. The control, reference, and test sediments are placed in solvent cleaned 1 L glass jars fitted with PTFE-lined screw caps. At the laboratory the samples are stored at 4°C in the dark. The original sealed containers may be stored for up to 8 weeks prior to testing, depending on the testing requirements. If jars are not full when received or if sediment is removed for testing, headspaces should be filled with nitrogen to retard deterioration. A negative control sediment is collected from a clean site. In addition, a reference sediment, a clean sediment with physical characteristics similar to the test sediments, may be employed as a comparison station.

### 4. TEST WATER

Test water (overlying water) at NAS is normally dechlorinated tap water or moderately hard synthetic water. Synthetic dilution water is prepared from Milli-Q reagent grade water and reagent grade chemicals. Test water may also be well water, surface water, site water, or other water depending on the study design. The hardness or other water quality parameters of the dilution water may need to be adjusted to meet the study design.

### 5. TEST ORGANISMS

5.1 Species: amphipod, *Hyalella azteca*.

5.2 Source: Cultured at NAS. Alternatively, animals may be purchased from a reputable commercial supplier.

5.3 Age: 7-8 days old at start of test

5.4 Acclimation and Pretest Observation: Cultures are maintained at  $23 \pm 1^\circ\text{C}$  under a 16:8 L:D photoperiod. Cultured amphipods are fed dried maple leaves with YTC. Rabbit chow, Tetramin® or TetraFin® flakes may also be used. Acclimation of test organisms to the test water may be desirable, depending on culture water, but it is not required. If test organisms are to be acclimated, fifty percent of the holding water is changed daily with the addition of test water.

### 6. DESCRIPTION OF TEST SYSTEM

6.1 Test Chambers and Environmental Control: Test chambers used in the toxicity test are 300-mL high-form lipless glass beakers. Test chambers are maintained at constant temperature by partial immersion in a temperature-controlled water bath or by placement in a temperature-controlled room. Aeration is not employed unless dissolved oxygen drops below 2.5 mg/L. The test is conducted under an illuminance of 100-1000 lux with a 16L:8D photoperiod.

6.2 Cleaning: All laboratory glassware, including test chambers, is cleaned as described in EPA/600/4-90/027F. New glassware and test systems are soaked 15 minutes in tap water and scrubbed with detergent (or cleaned in automatic dishwasher); rinsed twice with tap water; carefully rinsed once with fresh, dilute (10%, V:V) hydrochloric or nitric acid to remove scale, metals, and bases; rinsed twice with deionized water; rinsed once with acetone to remove organic compounds (using a fume hood or canopy); and rinsed three times with deionized water. Test systems and chambers are rinsed again with dilution water just before use.

## 7. EXPERIMENTAL DESIGN AND TEST PROCEDURES

7.1 Experimental Design: The test involves exposure of amphipods to test, control, and reference sediments. The sediments are placed on the bottom of the test containers and are overlain with test water. The test exposure is for 28 days. The renewal of overlying water consists of two volume additions per day, either continuous or intermittent. Each treatment consists of eight replicate test containers, each containing 10 organisms. Test chamber positions are completely randomized. Test organisms are randomly distributed to the test chambers. Blind testing is normally used.

7.2 Setup of Test Containers: Sediments are homogenized and placed in test chambers on the day before addition of test organisms. Sediment (100 ml) is placed into each of eight replicate beakers. After addition of the sediment, 175 ml of test water is gently added to each beaker in a manner to prevent resuspension. The overlying water is replaced twice daily. The test begins when amphipods are introduced to the test chambers. Initial water quality measurements are taken prior to the addition of test organisms.

7.3 Effect Criterion: The effect criteria used in the 28-day amphipod bioassay are mortality and growth. Death is defined as the lack of movement of body or appendages on response to tactile stimulation. Growth is measured as change in dry weight.

7.4 Test Conditions: No aeration is employed unless dissolved oxygen falls below 2.5 mg/L. The test temperature employed is  $23 \pm 1^\circ\text{C}$ . A 16:8, L:D photoperiod is used. Illumination is supplied by daylight fluorescent lamps at 100-1000lux. The overlying water is replaced twice daily.

7.5 Beginning the Test: On the day the test begins, amphipods are impartially counted into small containers of test water (10/container). The test is begun by rinsing test organisms into the equilibrated test containers. For the growth endpoint, time-zero weight data should be collected.

7.6 Feeding: Amphipods are fed 1.0 mL of YCT daily per test chamber. A feeding may be skipped if there is a build up of excess food. However, all beakers must be treated similarly.

7.7 Test Duration, Type and Frequency of Observations, and Methods: The duration of the toxicity test is 28 days. The type and frequency of observations to be made are summarized as follows:

| TYPE OF OBSERVATION                               | TIMES OF OBSERVATION   |
|---|--|
| <i>BIOLOGICAL DATA</i>                            |  |
| Survival, growth                                  | Day 28   |
| <i>PHYSICAL AND CHEMICAL DATA</i>                 |  |
| Hardness, alkalinity, conductivity, and ammonia-N | Beginning and end of test in overlying water of one replicate beaker from each treatment.  |
| Temperature                                       | Daily in overlying water of one replicate beaker from each treatment.  |
| Conductivity                                      | Weekly   |
| Dissolved oxygen and pH                           | 3X/week  |
| Optional pore water ammonia and/or sulfide        | In test sediments prior to initiating the tests.<br>Optionally in sediments from sacrificial test chambers at test beginning and/or end. |

Dissolved oxygen is measured using a polarographic oxygen probe calibrated according to the manufacturer's recommendations. The pH is measured using a pH probe and a properly calibrated meter with scale divisions of 0.1 pH units. Temperature is measured with a calibrated mercury thermometer or telethermometer. Conductivity is measured with a conductivity meter. Hardness and alkalinity are measured using titrimetric methods. Total soluble sulfide and total ammonia-N were

measured using Hach test kits based on the methylene blue (EPA Method 376.2) and salicylate (Clin. Chim. Acta 14:403, 1996) colorimetric methods, respectively; samples were not distilled prior to analysis.

Overlying water should be sampled just before water renewal from about 1 to 2 cm above the sediment surface using a pipet. It may be necessary to pool water samples from individual replicates. The pipet should be checked to make sure no organisms are removed during sampling of overlying water.

**7.8 Test Termination:** At test termination, the contents of each test container are sieved through a #35 (500  $\mu$ m mesh) sieve to recover the amphipods. Amphipods from each replicate are put into a 30 mL plastic cup, rinsed with DI water, gently blotted and placed into the appropriate tared aluminum weighing pan. The number of survivors for each container is recorded on the datasheet.

**7.9 Growth Measurement:** Growth is measured as average dry weight of animals in a test replicate at the end of the test on day 28. Pooled animals from each test replicate are gently blotted and placed into tared aluminum weigh pans. The pans are dried at 60-90°C to constant weight. The dried amphipods are placed into a dessicator and weighed as soon as possible to the nearest 0.01 mg (desirable to use 0.001 mg). The total weight of the dried amphipods in each pan is divided by the number of amphipods weighed to obtain an average dry weight per surviving amphipod per replicate.

## 8. CRITERIA OF TEST ACCEPTANCE

The test results are acceptable if the minimum survival of organisms in the control treatment at the end of the test is at least 80%.

## 9. DATA ANALYSIS

The endpoints of the toxicity test are survival and growth. Survival is obtained as a direct count of living organisms in each test container at the end of the test. Average amphipod dry weight, also measured at the end of the test, may be used to compare growth between treatment sediments and the control or reference sediment. Ordinarily the following data analysis is performed. Due to special requirements, alternative methods may be used. The means and standard deviations are calculated for each treatment level. Identification of toxic sediments is established by statistical comparison of test endpoints between test and control or reference sediments. Between treatment comparisons may be made using a Student's t-test or Wilcoxon's Two-Sample test, where each treatment is compared to the control or the reference sediment. An arcsine-square root transformation of proportional data, and tests for normality and heterogeneity of variances, are performed prior to statistical comparisons.

## 10. REPORTING

The final report of the test results must include all of the following standard information at a minimum: name and identification of the test; the investigator and laboratory; date and time of test beginning and end; information on the test material; information on the source and quality of the overlying/test water; detailed information about the test organisms including acclimation conditions; a description of the experimental design and test chambers and other test conditions including feeding, if any, and water quality; definition of the effect criteria and other observations; responses, if any, in the control treatment; tabulation and statistical analysis of measured responses and a summary table of endpoints; a description of the statistical methods used; any unusual information about the test or deviations from procedures; reference toxicant testing information.

11. STUDY DESIGN ALTERATION

Amendments made to the protocol must be approved by the sponsor and study director and should include a description of the change, the reason for the change, the date the change took effect and the dated signatures of the study director and sponsor. Any deviations in the protocol must be described and recorded in the study raw data.

12. REFERENCE TOXICANT

The reference toxicant test is a standard multi-concentration toxicity test using a specified chemical toxicant to evaluate the performance of test organisms used in the study. Reference toxicant tests are 96-hour, water only exposures, not 28-day sediment exposures. The reference toxicant test is run concurrently. Performance is evaluated by comparing the results of the reference toxicant test with historical results (e.g., control charts) obtained at the laboratory.

Test temperature (deg.C): 23

## Control Sediment:

Source: From an area approximately one mile east of the Hwy. 101 bridge at Beaver Creek,  
approx. 8 miles south of Newport, OR.Date collected: 8/14/11Sieved through 0.5 -mm screenStorage: 4°C in the dark in closed containers.NAS# 3820G

## MISCELLANEOUS NOTES

Light Intensity:

| Date    | Location   | Light Intensity (ft-candles*) | Initials |
|---------|------------|-------------------------------|----------|
| 8-30-11 | BEAKER #18 | 88.3                          | 601      |

\*To convert ft-candles to lux multiply by 10.76

## NAS Shipment Information

Species Hyalilla azteca

Date 8/23/11

Age/Size 4-5 d; 1.5 mm

P.O. No. verbal

Quantity 620+

Invoice No. 7312

Temperature 24°C Salinity — pH 7.93

Notes Thanks!

RECEIVED 8-24-11

-651

Biologist 

\*Please inspect shipment and report any problem immediately \*

## **TEST DATA ANALYSIS RECORDS**

### Endpoints Data Entry and Calculations File

**HOLD Weekday**  
FedEx location address  
**REQUIRED NOT** available for  
FedEx First Overnight.  
**HOLD Saturday**  
FedEx location address  
**REQUIRED** Available ONLY for  
FedEx Priority Overnight and  
FedEx 2Day to select locations.

**4 Express Package Service** \*To meet location.  
NOTE: Service order law changed. Please select carefully.

Packages up to 150 lbs.  
For packages over 250 lbs., use the separate  
FedEx Express Freight US Airbill.

**Next Business Day**

- ☐ **FedEx First Overnight**  
Earliest next business morning delivery to select locations. Friday shipments will be delivered on Monday unless SATURDAY Delivery is selected.
- ☒ **FedEx Priority Overnight**  
Next business morning \* Friday shipments will be delivered on Monday unless SATURDAY Delivery is selected.
- ☐ **FedEx Standard Overnight**  
Next business afternoon. Saturday Delivery NOT available.

**2 or 3 Business Days**

- ☐ **NEW FedEx 2Day A.M.**  
Second business morning. Saturday Delivery NOT available.
- ☐ **FedEx 2Day**  
Second business afternoon. \* Thursday shipments will be delivered on Monday unless SATURDAY Delivery is selected.
- ☐ **FedEx Express Saver**  
Third business day. Saturday Delivery NOT available.

**5 Packaging** \*Declared value limit \$500.

- ☐ FedEx Envelope\* ☐ FedEx Pak\* ☐ FedEx Box ☐ FedEx Tube ☒ Other

**6 Special Handling and Delivery Signature Options**

☐ **SATURDAY Delivery**  
NOT available for FedEx Standard Overnight, FedEx 2Day A.M., or FedEx Express Saver.

☒ **No Signature Required**  
Package may be left without obtaining a signature for delivery.

☐ **Direct Signature**  
Someone at recipient's address every sign for delivery. Fee applies.

☐ **Indirect Signature**  
If no one is available at recipient's address, someone at a neighboring address may sign for delivery. For residential deliveries only. Fee applies.

**Does this shipment contain dangerous goods?**

- One box must be checked:  
☐ No ☐ Yes As per attached Shipper's Declaration. ☐ Yes Shipper's Declaration not required. ☐ Dry Ice Dry Ice, 5, UN 1845 ☐ Cargo Aircraft Only

**7 Payment Bill to:**

- ☒ **Sender** Acct. No. in Section 1 will be billed. ☐ Recipient ☐ Third Party ☐ Credit Card ☐ Cash/Check

Total Packages Total Weight Total Declared Value\* Credit Card Acct. No.

\*Our liability is limited to \$500 unless you declare a higher value. See the current FedEx Service Guide for details.

#### **RAW DATA – REFERENCE TOXICANT TEST**

## ACUTE TOXICITY TEST (ALL SPECIES)

Test No. 999-2930 Client: QC Test

Test Type (ranging/definitive)

Investigator

Test Length (hr)

96

Species *Hyalella azteca*REVIEWED  
PAGES 1-7  
-651

## STUDY MANAGEMENT

Client: QC test

Client's Study Monitor: QC test

Testing Laboratory: Northwestern Aquatic Sciences

Test Location: Newport Laboratory

Laboratory's Study Personnel:

Proj. Man./Study Dir. G.J. Irissarri 651

QA Officer L. K. Nemeth

1. GA B. J. L. 651 2.

3. 4.

Test Beginning: 8-26-11 0950

Test Ending: 8-30-11 1050

## TEST MATERIAL

Description: Potassium Chloride Crystals - Lot No.: FISHER 073280

NAS Sample No.

Date of Collection:

Date of Receipt:

Temperature (deg C):

Dissolved oxygen (mg/L):

pH:

Conductivity (umhos/cm):

Hardness (mg/L):

Alkalinity (mg/L):

Salinity (ppt):

Total chlorine (mg/L):

Total ammonia-N (mg/L):

## DILUTION WATER

Description: Moderately hard synthetic water

Date of Preparation/Collection: 8-22-11

Water Quality: Cond. (umhos/cm): 256

Salinity (ppt) pH 7.9

Hardness (mg/L as CaCO<sub>3</sub>): 86Alkalinity (mg/L as CaCO<sub>3</sub>): 70

Treatments: Aerated ≥ 24 hrs

## TEST LOCATION

Test conducted in (circle one): room 1 room 2 trailer water bath other:

Photoperiod during acclimation: 16:8, L:D

**TEST PROCEDURES AND CONDITIONS**

Test concentrations (50% series recommended): 1, 0.5, 0.25, 0.125, 0.063 0 g/L

Test chamber: 250 ml glass beakers Test volume: 100 ml  
Replicates/treatment: 2 Organisms/treatment: 20 (10/rep)  
Test water changes: None Aeration during test: None  
Feeding: 0.5 ml YTC suspension per beaker on days 0 and 2

Duration: 24-hr, 48-hr, 96-hr Test temperature (deg.C): 23 ± 1 or 20 ± 1  
Beaker placement: Stratified randomization Photoperiod: 16:8, L:D

**MISCELLANEOUS NOTES**

**Test solution preparation:**

Working stock: Dissolve 0.5g KCl crystals in dilution water and dilute to 500 mL.  
Final conc.: 1.0 g/L.

| Test concentration<br>(g/L) | KCl working stock<br>(ml/200ml) | Dilution water  |

## TOXICITY TEST REPORT

## TEST IDENTIFICATION

Test No.: 826-2

Title: Toxicity of freshwater sediments collected from Kitsap County, WA using a 10-day midge, *Chironomus dilutus* (formerly *C. tentans*), sediment bioassay as part of Project No. 002233.0599.01SF, TDD No. 10-08-0011.

Protocol No.: NAS-XXX-CT4b, April 7, 1998. Revision 1 (10-28-03). Based on ASTM 2001 (Standard test methods for measuring the toxicity of sediment-associated contaminants with fresh water invertebrates, E1706-00), Am. Soc. Test. Mat., Phila., PA, and EPA Method 100.2 (Methods for measuring the toxicity and bioaccumulation of sediment-associated contaminants with freshwater invertebrates, EPA/600/R-99/064).

## STUDY MANAGEMENT

Study Sponsor: Ecology and Environment, Inc., 720 Third Ave., Suite 1700, Seattle, WA 98104

Sponsor's Study Monitor: Mr. Mark Woodke

Testing Laboratory: Northwestern Aquatic Sciences, P.O. Box 1437, Newport, OR 97365

Test Location: Newport laboratory

Laboratory's Study Personnel: G.J. Irissarri, B.S., Proj. Man./Study Dir.; L.K. Nemeth, B.A., M.B.A., QA Officer; R.S. Caldwell, PhD, Sr. Aq. Toxicologist; G.A. Buhler, B.S., Aq. Toxicologist; L.P. Sandoval, B.S., Tech.; Y. Nakahama, Tech., B. Hurst, M.S., Tech.

Study Schedule:

Test Beginning: 8-26-11, 1155 hrs.

Test Ending: 9-5-11, 1330 hrs.

Disposition of Study Records: All raw data, reports and other study records are stored at Northwestern Aquatic Sciences, 3814 Yaquina Bay Rd., Newport, OR 97365.

Statement of Quality Assurance: The test data were reviewed by the Quality Assurance Unit to assure that the study was performed in accordance with the protocol and standard operating procedures. This report is an accurate reflection of the raw data.

## TEST MATERIAL

Test Sediments: Freshwater test sediments collected as part the characterization of Terminal 5 for the Port of Portland. Details are as follows:

|                 |          |          |          |          |
|-----------------|----------|----------|----------|----------|
| NAS Sample No.  | 3838G    | 3839G    | 3840G    | 3841G    |
| Description     | 11070001 | 11070002 | 11070003 | 11070004 |
| Collection Date | 7/27/11  | 7/27/11  | 7/27/11  | 7/27/11  |
| Receipt Date    | 8/14/11  | 8/24/11  | 8/24/11  | 8/24/11  |

Control Sediment: The negative control sediment (NAS#3820G) was collected on 8-14-11 from an area approximately one mile east of the Hwy. 101 bridge at Beaver Creek, approx. 8 miles south of Newport, OR.

Treatments: Homogenized at test set up by mixing using stainless steel implements.

Storage: All test and control sediments were stored at 4°C in the dark in sealed containers until used.

## TEST WATER

Source: Dechlorinated municipal tap water.

Date of Preparation: 8-25-11, 8-26-11

Water Quality:

pH: 7.6, 7.5

conductivity: 136, 143 µmhos/cm

hardness: 43, 43 mg/L as CaCO<sub>3</sub>

alkalinity: 30, 30 mg/L as CaCO<sub>3</sub>.

total chlorine: both collections were below 0.02 mg/L

Pretreatment: Dechlorinated and aerated ≥24 hr.

## TEST ORGANISMS

Species: *Chironomus dilutus* (formerly *C. tentans*), midge.

Size: 3rd instar, mean initial wt:  $0.14 \pm 0.01$  mg

Source: NAS cultures, originally obtained from EPA, Duluth, MN.

Acclimation: Holding conditions prior to testing averaged: Temperature,  $21.9 \pm 0.5^\circ\text{C}$ ; dissolved oxygen,  $8.1 \pm 0.3$  mg/L; pH,  $7.4 \pm 0.3$ ; conductivity,  $161 \pm 3$   $\mu\text{mhos/cm}$ ; hardness, 52 mg/L as  $\text{CaCO}_3$ ; and alkalinity, 30 mg/L as  $\text{CaCO}_3$ . Photoperiod was 16:8, L:D. Half of the water in culture tanks was replaced twice weekly with dechlorinated municipal tap water during holding. Animals were fed Tetra Fin suspension and *Selenastrum*.

## TEST PROCEDURES AND CONDITIONS

The following is an abbreviated statement of the test procedures and a statement of the test conditions actually employed. See the test protocol (Appendix I) for a more detailed description of the test procedures used in this study.

Test Chambers: 300 ml high-form glass beakers

Test Volumes: 100 ml sediment layer; 175 ml test water.

Replicates/Treatment: 8 (plus one additional WQ beaker for the four test sediments)

Organisms/Treatment: 80

Water Volume Changes: 2 water volumes per day

Aeration: None.

Feeding: Animals were fed 1.5 ml of Tetra Fin suspension (1.5 ml contains 6 mg dry solids) per beaker daily.

Effects Criteria: 1) survival after 10 days, and 2) average individual biomass (based on ash-free dry weight) after 10 days. Death is defined as no visible movement or response to tactile stimulation. Missing organisms were considered to be dead.

Water Quality and Other Test Conditions: The temperature, dissolved oxygen, conductivity, pH, hardness, alkalinity and ammonia-nitrogen were measured in the overlying water of one replicate test container per treatment on days 0 and 10 of the test. Temperature and dissolved oxygen were measured daily in the overlying water of one replicate test container per treatment. Hardness and alkalinity were measured with titrimetric methods. Ammonia-N was measured using Hach reagents based on the salicylate (Clin. Chim. Acta 14:403, 1996) colorimetric method; samples were not distilled prior to analysis. The photoperiod was 16:8, L:D.

## DATA ANALYSIS METHODS

Survival and individual biomass were calculated for each replicate as follows:

percent survival =  $100 \times (\text{number surviving}/\text{initial number tested})$

average individual ash-free dry wt. =  $(\text{ash-free dry wt.})/\text{number weighed}$ ,

where:

ash-free dry wt. = dry weight of organisms recovered on day 10 – ashed dry weight, in mg

Means and standard deviations for the biological endpoints described above, and for water quality data, were computed using Microsoft Excel 2000. The values for percent mortality and individual ash-free dry wt for each test sediment were statistically compared against the reference sediment. Where appropriate, an arcsine square root transformation was performed on proportional mortality data before analysis. Following determination of normality and homogeneity of variances, a one-tailed Student T-test, Mann-Whitney or Approximate T test was conducted at the 0.05 level of significance. The statistical software used was BioStat (Beta v.4.1 (EXCEL)) bioassay software developed by the U.S. Army Corps of Engineers, Seattle District.

## PROTOCOL DEVIATIONS

None

## REFERENCE TOXICANT TEST

The reference toxicant test is a multi-concentration toxicity test using potassium chloride, to evaluate the performance of the test organisms used in the sediment toxicity test. The performance is evaluated by

comparing the results of this test with historical results obtained at the laboratory. A summary of the reference toxicant test result is given below. The reference toxicant test raw data are found in Appendix III.

Test No.: 999-2931

Reference Toxicant and Source: Potassium Chloride (KCl), Fisher Lot #073280.

Test Date: 8-26-11.

Dilution Water Used: Moderately hard synthetic water prepared from Milli-Q<sup>®</sup> deionized water.

Result: 96-hr LC50, 6.27. This result is within the laboratory's control chart warning limits (3.01– 7.76 g/L).

## TEST RESULTS

Observations of water quality in the overlying water throughout the test are summarized in Table 1. A detailed tabulation of the water quality results by sample and test day can be found in Appendix II. The means and standard deviations of percent mortality and growth (ash-free dry wt.) of midges exposed for 10 days to sediments are summarized in Tables 2 and 3. Detailed data organized by sample and replicate, and summary statistics for these observations, are given in Appendix II.

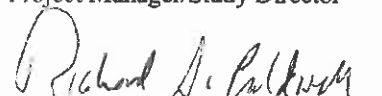

All water quality observations of overlying water were within the protocol specified ranges. Ammonia-N in the overlying water ranged between <0.1 and 1.5 mg/L for all day 0 and day 10 measurements.

The test met the survival and weight acceptability criteria specified in the test protocol with 15.0% mean control mortality ( $\leq 30\%$  required) and a control individual mean ash-free dry weight of 0.85 mg per larvae ( $\geq 0.48$  mg required). The reference toxicant (positive control) result was within the laboratory's control chart limits (6.27 g/L; control chart mean  $\pm 2$  S.D. =  $5.38 \pm 2.37$ ). It is concluded, therefore, that the test has developed fully acceptable data for use in making management decisions.

The percent mortality of all test sediments was not significantly greater than that of the control. The average individual biomass of test sediments 11070002, 11070003, and 11070004 was significantly less than that of the control at the 0.05 level of significance.

\* Pupae were not included in the sample to estimate ash-free dry weight (as per EPA/600/R-99/064, p. 59, section 12.3.8.2)

**APPENDIX I**  
**PROTOCOL**

**TEST PROTOCOL**

**FRESHWATER MIDGE, *CHIRONOMUS TENTANS*,  
10-DAY SEDIMENT TOXICITY TEST**

**1. INTRODUCTION**

1.1 Purpose of Study: The purpose of this study is to characterize the toxicity of freshwater sediments based on midge survival and growth using the midge, *Chironomus tentans*.

1.2 Referenced Method: This protocol is based on EPA Method 100.2 (EPA/600/R-99/064) and ASTM Method E 1706-00 (ASTM 2001).

1.3 Summary of Method: A summary of test conditions for the midge 10-day sediment toxicity test is tabulated below. The 10-day sediment toxicity test with *Chironomus tentans* is conducted at 23°C with a 16L:8D photoperiod at an illuminance of about 100-1000 lux. Test chambers are 300-mL high-form lipless beakers containing 100 mL of sediment and 175 mL of overlying water. Ten second to third-instar midges are used in each replicate (all organisms must be third instar or younger and at least 50% of the larvae must be third instar). The number of replicates/treatment depends on the objective of the test. Eight replicates are recommended for routine testing. Midges in each test chamber are fed 1.5 mL of a 4 g/L fish food flakes suspension daily. Each chamber receives two volume additions per day of overlying water. Overlying water can be culture water, well water, surface water, site water, or reconstituted water. Test endpoints include survival and/or growth.

Aquatic Toxicologist: \_\_\_\_\_

2.6 Proposed Testing Schedule: Tests are to begin within 14 days of sample collection. Eight week holding times may apply in some circumstances. Reference toxicant test to be run concurrently.

2.7 Good Laboratory Practices: The test is conducted following the principles of Good Laboratory Practices (GLP) as defined in the EPA/TSCA Good Laboratory Practice regulations revised August 17, 1989 (40 CFR Part 792).

### 3. TEST MATERIAL

The test materials are freshwater sediments. The control, reference, and test sediments are placed in solvent cleaned 1 L glass jars fitted with PTFE-lined screw caps. At the laboratory the samples are stored at 4°C in the dark. The original sealed containers may be stored for up to 14 days prior to testing. Eight week holding times may apply in some circumstances. If jars are not full when received or if sediment is removed for testing, headspaces should be filled with nitrogen to retard deterioration. A negative control sediment is collected from a clean site. In addition, a reference sediment, a clean sediment with physical characteristics similar to the test sediments, may be employed as a comparison station.

### 4. TEST WATER

Test water (overlying water) at NAS is normally *C. tentans* culture water, which is moderately hard synthetic water at a hardness of 80-100 mg/L as CaCO<sub>3</sub> and alkalinity of 60-70 mg/L as CaCO<sub>3</sub>. Dilution water is prepared from Milli-Q reagent grade water and reagent grade chemicals. Test water may also be well water, surface water or site water depending on the study design.

### 5. TEST ORGANISMS

5.1 Species: midge, *Chironomus tentans*.

5.2 Source: Cultured at NAS (Originally obtained from U.S. EPA Environmental Research Lab, Duluth, MN) or purchased from a reputable commercial supplier.

5.3 Age: Third instar or younger larvae (at least 50% of the larvae must be in the third instar at the start of the test). Third instar is normally 9 to 11 days after hatching; head capsule widths range from 0.33 to 0.45 mm; or length ranges from 4-6 mm; or dry weight ranges 0.08 to 0.23 mg/individual.

5.4 Acclimation and Pretest Observation: Cultures are maintained at 23 ± 1°C under a 16:8 L:D photoperiod. The culture water is moderately hard synthetic water. Midge are fed finely ground Tetrafin flakes in suspension (10g Tetrafin in 100 mL Milli-Q water). Mortality during the 48-hr prior to testing should not be excessive.

### 6. DESCRIPTION OF TEST SYSTEM

6.1 Test Chambers and Environmental Control: Test chambers used in the toxicity test are 300-mL high-form lipless glass beakers (Pyrex® 1040 or equivalent). Test chambers are maintained at constant temperature by partial immersion in a temperature-controlled water bath or by placement in a temperature-controlled room. Aeration is not employed unless dissolved oxygen drops below 2.5 mg/L. The test is conducted under an illuminance of 100 to 1000 lux with a 16L:8D photoperiod.

6.2 Cleaning: All laboratory glassware, including test chambers, is cleaned as described in EPA/600/4-90/027F. New glassware and test systems are soaked 15 minutes in tap water and scrubbed with detergent (or cleaned in automatic dishwasher); rinsed twice with tap water; carefully rinsed once with fresh, dilute (10%, V:V) hydrochloric or nitric acid to remove scale, metals, and bases; rinsed twice with deionized water; rinsed once with acetone to remove organic compounds (using a fume hood or canopy); and rinsed three times with deionized water. Test systems and chambers are rinsed again with dilution water just before use.

### 7. EXPERIMENTAL DESIGN AND TEST PROCEDURES

7.1 Experimental Design: The test involves exposure of midge larvae to test, control, and reference sediments. The sediments are placed on the bottom of the test containers and are overlain with test water. The test exposure is

for 10 days. The renewal of overlying water consists of two volume additions per day, either continuous or intermittent. Each treatment consists of eight replicate test containers, each containing 10 organisms. Test chamber positions are completely randomized. Test organisms are randomly distributed to the test chambers. Blind testing is normally used.

**7.2 Setup of Test Containers:** Sediments are homogenized and placed in test chambers on the day before addition of test organisms. Sediment (100 ml) is placed into each of eight replicate beakers. After addition of the sediment, 175 ml of test water is gently added to each beaker in a manner to prevent resuspension. The overlying water is replaced twice daily. The test begins when midges are introduced to the test chambers. Initial water quality measurements are taken prior to the addition of test organisms.

**7.3 Effect Criterion:** The acute effect criterion used in the midge bioassay is mortality, defined as the lack of movement of body or appendages on response to tactile stimulation. The optional chronic effect criterion is growth which is determined by using dry weight measurements.

**7.4 Test Conditions:** No aeration is employed unless dissolved oxygen falls below 2.5 mg/L. The test temperature employed is 23°C (range of  $\pm 1^\circ\text{C}$ ). A 16:8, L:D photoperiod is used. Illumination is supplied by daylight fluorescent lamps at 100-1000 lux. The overlying water is replaced twice daily.

**7.5 Beginning the Test:** The test is begun by adding the organisms to the equilibrated test containers as previously described. Three extra replicates of midge larvae should be counted out and randomly selected for drying to determine initial average weight and instar data.

**7.6 Feeding:** Midge larvae are fed 1.5 mL daily per test chamber (1.5 mL contains 6.0 mg of dry solids). A feeding may be skipped if there is a build up of excess food. However, all beakers must be treated similarly.

**7.7 Test Duration, Type and Frequency of Observations, and Methods:** The duration of the acute toxicity test is 10 days. The type and frequency of observations to be made are summarized as follows:

| Type Of Observation  | Times Of Observation  |
|--|---|
| <b>Biological Data</b>   |   |
| Survival, growth   | Day 10  |
| <b>Physical And Chemical Data</b>  |   |
| Hardness, alkalinity, ammonia-N, conductivity, pH, dissolved oxygen, and temperature | Beginning and end of test in overlying water of one replicate beaker from each treatment. |
| Dissolved oxygen, temperature  | Daily in overlying water of one replicate beaker from each treatment.                     |

Dissolved oxygen is measured using a polarographic oxygen probe calibrated according to the manufacturer's recommendations. The pH is measured using a pH probe and a properly calibrated meter with scale divisions of 0.1 pH units. Temperature is measured with a calibrated mercury thermometer or telethermometer. Conductivity is measured with a conductivity meter. Hardness and alkalinity are measured using titrometric methods. Ammonia-nitrogen is measured using the salicylate colorimetric method (Clin. Chim. Acta 14:403, 1996).

**7.8 Growth Measurement:** Growth is measured as ash-free dry weight (AFDW) of animals in a test replicate at the end of the test on day 10. Pooled animals from each test replicate are rinsed with deionized water, gently blotted and placed into tared aluminum weigh pans. The pans are dried at 60-90°C to constant weight. The dried organisms are placed into a dessicator and weighed as soon as possible to the nearest 0.01 mg (desirable to use 0.001 mg). The total weight of the dried midge in each pan is divided by the number of midge weighed to obtain an average dry weight per midge. The dried larvae in the pan are then ashed at 550°C for two hours. The pan with the ashed larvae is then reweighed and the tissue mass of the larvae is determined as the difference between the weight

of the dried larvae plus pan and the weight of the ashed larvae plus pan. Pupae or adult organisms are not included in the sample to estimate AFDW.

8. CRITERIA OF TEST ACCEPTANCE:

The test results are acceptable if the minimum survival of organisms in the control treatment at the end of the test is at least 70% and the average ash-free dry weight of *C. tentans* in the surviving controls is at least 0.48 mg.

9. DATA ANALYSIS

The endpoints of the toxicity test are survival and growth. Survival is obtained as a direct count of living organisms in each test container at the end of the test. Average midge ash-free dry weight, also measured at the end of the test, may be used to compare growth between treatment sediments and the control or reference sediment. Ordinarily the following data analysis is performed. Due to special requirements, alternative methods may be used. The means and standard deviations are calculated for each treatment level. Identification of toxic sediments is established by statistical comparison of test endpoints between test and control or reference sediments. Between treatment comparisons may be made using a Student's t-test or Wilcoxon's Two-Sample test, where each treatment is compared to the control or the reference sediment. An arcsine-square root transformation of proportional data, and tests for normality and heterogeneity of variances, are performed prior to statistical comparisons.

10. REPORTING

The final report of the test results must include all of the following standard information at a minimum: name and identification of the test; the investigator and laboratory; date and time of test beginning and end; information on the test material; information on the source and quality of the overlying/test water; detailed information about the test organisms including acclimation conditions; a description of the experimental design and test chambers and other test conditions including feeding, if any, and water quality; definition of the effect criteria and other observations; responses, if any, in the control treatment; tabulation and statistical analysis of measured responses and a summary table of endpoints; a description of the statistical methods used; any unusual information about the test or deviations from procedures; reference toxicant testing information.

11. STUDY DESIGN ALTERATION

Amendments made to the protocol must be approved by the sponsor and study director and should include a description of the change, the reason for the change, the date the change took effect and the dated signatures of the study director and sponsor. Any deviations in the protocol must be described and recorded in the study raw data.

12. REFERENCE TOXICANT

The reference toxicant test is a standard multi-concentration toxicity test using a specified chemical toxicant to evaluate the performance of test organisms used in the study. Reference toxicant tests are 96-hour, water only exposures, not 10-day sediment exposures. The reference toxicant test is run concurrently. Performance is evaluated by comparing the results of the reference toxicant test with historical results (e.g., control charts) obtained at the laboratory.

Photoperiod during acclimation: 16:8, L:D**TEST PROCEDURES AND CONDITIONS**

Test chambers: 300 ml glass beakers

Test volumes: 100 ml of test sediment; 275 ml total volume

Replicates/treatment: (8) 8 Organisms/treatment: (80) 80 (10/REP)

Test water changes: Twice daily

Aeration: only if DO falls below 2.5 mg/L

Beaker placement: Total randomization

Feeding: everyday beginning with day zero

Photoperiod: 16:8, L:D

Test temperature (°C): 23 ± 1

**Control Sediment:**Source: From an area approximately one mile east of the Hwy. 101 bridge at Beaver Creek,  
approx. 8 miles south of Newport, OR.Date collected: 0.5 8/14/11Sieved through                     -mm screenStorage: darkness at 4°C, in sealed containersNAS# 3820G**MISCELLANEOUS NOTES**

RE: 10-08-0011, (GTX-11124)

Dear Tim:

Enclosed are the test results you requested for the above referenced project. GeoTesting Express, Inc. (GTX) received 18 samples from you between 9/2/2011 and 9/6/2011. These samples were labeled as follows:

| Boring Number | Depth |
|---------------|-------|
| SB-01         | 20.5  |
| SB-01         | 25    |
| SB-01         | 50-52 |
| SB-02         | 22    |
| SB-02         | 30.5  |
| SB-02         | 50.5  |
| SB-02         | 55    |
| SB-03         | 20.5  |
| SB-03         | 21    |
| SB-03         | 25    |
| SB-03         | 50    |
| SB-03         | 57.5  |
| SB-04         | 10    |
| SB-04         | 10.5  |
| SB-04         | 11    |
| SB-05         | 20    |
| SB-05         | 25.5  |
| SB-05         | 55    |

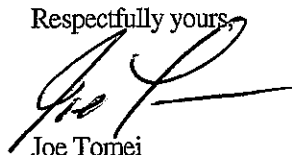

GTX performed the following tests on these samples:

- 9 ASTM D 422 - Grain Size Analyses (sieve only)
- 9 ASTM D 3080 - Direct Shear Test Points

A copy of your test request is attached.

The results presented in this report apply only to the items tested. This report shall not be reproduced except in full, without written approval from GeoTesting Express. The remainder of these samples will be retained for a period of sixty (60) days and will then be discarded unless otherwise notified by you. Please call me if you have any questions or require additional information. Thank you for allowing GeoTesting Express the opportunity of providing you with testing services. We look forward to working with you again in the future.

Respectfully yours,

Joe Tomei

## WARRANTY and LIABILITY

GeoTesting Express (GTX) warrants that all tests it performs are run in general accordance with the specified test procedures and accepted industry practice. GTX will correct or repeat any test that does not comply with this warranty. GTX has no specific knowledge as to conditioning, origin, sampling procedure or intended use of the material.

GTX may report engineering parameters that require us to interpret the test data. Such parameters are determined using accepted engineering procedures. However, GTX does not warrant that these parameters accurately reflect the true engineering properties of the *in situ* material. Responsibility for interpretation and use of the test data and these parameters for engineering and/or construction purposes rests solely with the user and not with GTX or any of its employees.

GTX's liability will be limited to correcting or repeating a test which fails our warranty. GTX's liability for damages to the Purchaser of testing services for any cause whatsoever shall be limited to the amount GTX received for the testing services. GTX will not be liable for any damages, or for any lost benefits or other consequential damages resulting from the use of these test results, even if GTX has been advised of the possibility of such damages. GTX will not be responsible for any liability of the Purchaser to any third party.

## Commonly Used Symbols

|            |   |                          |   |
|------------|---|--------------------------|---|
| A          | pore pressure parameter for $\Delta\sigma_1 - \Delta\sigma_3$   | T                        | temperature                                     |
| B          | pore pressure parameter for $\Delta\sigma_3$                    | t                        | time  |
| CIU        | isotropically consolidated undrained triaxial shear test        | U, UC                    | unconfined compression test                     |
| CR         | compression ratio for one dimensional consolidation             | UU, Q                    | unconsolidated undrained triaxial test          |
| $C_c$      | coefficient of curvature, $(D_{30})^2 / (D_{10} \times D_{60})$ | $u_a$                    | pore gas pressure                               |
| $C_u$      | coefficient of uniformity, $D_{60}/D_{10}$                      | $u_e$                    | excess pore water pressure                      |
| $C_c$      | compression index for one dimensional consolidation             | $u, u_w$                 | pore water pressure                             |
| $C_\alpha$ | coefficient of secondary compression                            | V                        | total volume                                    |
| $c_v$      | coefficient of consolidation                                    | $V_g$                    | volume of gas                                   |
| c          | cohesion intercept for total stresses                           | $V_s$                    | volume of solids                                |

*This page intentionally left blank.*

## **Appendix C -- Gorst Creek Streamlined Human Health Risk Evaluation**

### **C.1 Streamlined Human Health Evaluation**

This section presents a streamlined human health risk evaluation (HHRE) for the Gorst Creek – Bremerton Auto Wrecking Landfill. The streamlined evaluation is intended to focus on the specific problem that the EE/CA for the site is addressing, which is to identify the scope of the removal action for the site. In a streamlined evaluation, the chemicals of potential concern (COPCs) for which actions may be taken are identified by defining potential exposure pathways and receptors, and comparing analyte concentrations to screening levels. Screening levels are conservative risk-based criteria consistent with the pathways and receptors identified. This evaluation was performed in accordance with federal guidance for assessing risks associated with non-time critical removal actions (USEPA 1993) and other applicable federal and state human health risk assessment guidance (USEPA 1989 and 2010a, Ecology 2007).

The HHRE is organized in the following sections:

Section C.1 describes site data that is included in the HHRE

Section C.2 presents the conceptual site model (CSM) for human health

Section C.3 describes the exposure pathways and receptors identified in the CSM

Section C.4 describes screening values used for the HHRE

Section C.5 compares site data with screening values and presents the results

Section C.7 discusses the uncertainties with the HHRE

Section C.8 presents a summary of the HHRE

### **C.2 Data Used for HHRE**

Environmental media samples have been collected at the Gorst Creek Landfill site at different times beginning in 2000, then in 2003, and most recently in 2011. The quantitative portion of the HHRE is primarily based on the data collected during the July 2011 field investigation because these data represent current conditions. With one exception, historical data from the site hazard assessment (Hart Crowser 2000) and the integrated assessment (E & E 2004) were used primarily for field investigation planning purposes and to help develop the CSM described above. However, surface water samples were not collected during the 2011 field investigation due to the lack of water flow in Gorst Creek in the vicinity of the site. In this case, the historical surface water data were relied upon for the screening level comparison.

During the 2011 investigation, seven surface soil samples (LF01SS to LF07SS) were collected from the landfill surface (0 to 6 inches bgs), four sediment samples (GC01SD to GC04SD) were collected from Gorst Creek near the landfill, and one groundwater sample (SB04) was collected northwest of the landfill. Two of the sediment samples (GC01SD and GC02SD) were collected upstream from the landfill and two sediment samples (GC03SD and GC04SD) were collected downstream from the landfill. Samples collected during July 2011 were analyzed for metals, VOCs, SVOCs, PCBs, and pesticides. Sample location maps and additional information about sample collection and results are provided in Section 1.4.3.

For the HHRE, historical surface water data from November 2003 were used, including results from two samples collected from the site's probable points of entry (PPEs) and one background sample collected 0.3 mile upstream of the first PPE (E&E 2004). These surface water samples were analyzed for metals SVOCs, VOCs, and PCBs/pesticides (E&E 2004).

### **C.3 Human Health Conceptual Site Model**

The human health CSM provides an overall picture of site conditions as they relate to the HHRE. The CSM is a tool used to identify the following:

- the primary source of contamination in the environment;
- how chemicals at the original point of release migrate through the environment;
- the types of human populations who might come into contact with contaminated media; and
- the potential exposure pathways that may occur for each population.

In risk assessment, exposure pathways are means by which chemicals move from the contaminated media to a point of contact by receptors. They describe the exposure medium (e.g., surface soil) and the exposure route (e.g., incidental ingestion). A complete exposure pathway must exist for exposure and subsequent risks to occur. If one or more of the aforementioned elements is missing, the exposure pathway is not considered complete and is not evaluated in the HHRE (USEPA 1989).

The CSM for the Gorst Creek Landfill site is provided in Figure 1-5. Based on local land use and zoning information, exposure scenarios evaluated in the HHRE include current and future residential, current and future worker, current and future trespasser, and current and future recreational. Human receptors at the Gorst Creek Landfill site could be exposed to chemicals through contact with surface soil, sediment, surface water, and groundwater. Potential routes of exposure include ingestion, dermal absorption, and inhalation. Descriptions of exposure pathways and receptors, including a summary of area land use and zoning, are provided in the following section.

### **C.4 Exposure Pathways and Receptors**

#### *Residential*

A residential exposure scenario is included in the HHRE due to the proximity of current and potential future residential properties to the site. The population residing within a 1-mile radius of the site includes 1,027 people and within a 4-mile radius is 8,425 people (see Table C-1). Sunnyslope Elementary School is located within 1 mile of the site, and Pleasant Valley School is located within 3 miles of the site. No other schools or daycare facilities are located within 1 mile of the site (USGS 2011).

The landfill site and immediate properties to the northeast are zoned “business center” and are not occupied by residents. Adjoining land is zoned as incorporated city and rural residential (Kitsap County 2010a). The landfill site is bordered by an auto wrecking facility, a privately-owned Christmas tree plantation (Alpine Farms), McCormick Land Co., Washington State Department of Transportation property which contains a highway and easement corridors, and one private residential property. There are no other residential properties bordering the site. Kitsap County comprehensive land use planning indicates that the zoning will remain the same in the future for the site property and surrounding area (Kitsap County 2010b).

Two exposure pathways for residents were initially considered in the CSM: exposure to contaminants in groundwater and in onsite surface soil. Consumption of and dermal contact with groundwater as drinking water are considered potentially complete exposure pathways for residents because municipal and domestic wells are completed in aquifers in which site contaminants may have infiltrated. As discussed in Section 1.2.3, several aquifers are present in the region. While not all of the aquifers are used for drinking water purposes, all are available to be used as drinking water.

Table C-1 presents a tally of various drinking water wells located within a 4-mile radius of the Gorst Creek Landfill site. There are 587 domestic wells and 40 municipality wells serving a population of more than 8,400 people. The residential population relying on domestic wells is approximately 1,500 persons,

which was determined by multiplying the number of domestic wells within 4 miles by the number of persons per Kitsap County household (USCB 2010 and 2011, WDOE 2011a).

Exposure to contaminants in onsite soil is not considered a complete pathway for residents. Access to the site is restricted to an easement through the adjacent Airport Auto Wrecking, Too facility. In addition, the future land use of the property is expected to remain industrial or commercial and therefore will not be occupied by residents. The site is not a desirable location for recreational purposes and residents are not expected to hike around the site. The majority of the site is covered with vegetation, limiting the potential for windblown soil and dust. While there may be small patches of exposed soil (i.e., with little or no vegetation), residential and school properties are located far enough from the site such that receptors would not likely have exposure to windblown soil and dust from the site.

#### *Workers*

A future worker scenario is evaluated in the HHRE because future land use plans at the site indicate that zoning will remain industrial and commercial. Therefore, if no cleanup action is taken at the site, workers onsite in the future may have contact with COPCs in soil via incidental ingestion, dermal contact, and particulate inhalation. A current worker scenario was also evaluated for workers on adjacent properties (i.e., Airport Auto Wrecking, Too facility) because workers may have limited exposure potential via windblown soil and dust from the site. Data for soil samples collected up to 0 to 6 inches bgs were included in the screening analysis due to potential erosion of surficial soil over time. VOCs were not detected during air monitoring; therefore, inhalation of volatiles was not evaluated as an exposure route.

#### *Trespassers*

A current trespasser scenario is evaluated in the HHRE because there are reported cases of individuals trespassing on the site for scrap metal. Although vehicular access to the site is restricted to an easement through the auto wrecking facility, the site is not fenced and access to pedestrians is not restricted. It is assumed that the site will be eventually developed in the future for industrial or commercial purposes (Kitsap County 2010b). Trespassers could have direct contact with contaminants in surface soil via incidental ingestion, dermal contact, and particulate inhalation. Data for soil samples collected 0 to 6 inches bgs were evaluated to account for contact with surface soil currently exposed as well as with soil that may be exposed over time due to natural erosion. VOCs were not detected during air monitoring; therefore, inhalation of volatiles was not evaluated as an exposure route.

#### *Recreational Users*

Current and future recreational scenarios are evaluated in the HHRE. As discussed in Section 1.3, contaminants from the landfill may be seeping into Gorst Creek. In addition, soil from the landfill may erode directly into the creek. Visitors to the area and residents have the potential for exposure via direct contact with surface water and sediment while wading in Gorst Creek. There is generally unrestricted access at various points along the creek, as well as a recreational park (Otto Jarstad Park) located within 4 miles downstream of the site. A tribal fishery is also located near the mouth of Gorst Creek, on Sinclair Inlet, approximately 3.7 miles downstream of the site. The fishery is supported by a tribal Chinook salmon fish-rearing facility, located on Gorst Creek approximately 2.7 miles downstream of the site and 1 mile upstream of the confluence with Sinclair Inlet (Zischke 2003). Fishing reportedly does not occur on Gorst Creek downstream of the site; rather, fish are harvested from Sinclair Inlet (Huff 2003). In addition, a golf course is located near the landfill site and Gorst Creek; however, it relies on City of Bremerton municipal water for irrigation and drinking water (Folk 2011).

### **C.5 Screening Values for the HHRE**

The USEPA (1989) suggests that, at sites where a large number of chemicals are present, it can be useful to eliminate from further consideration those chemicals that represent a small contribution to risk. To accomplish this, site concentrations of chemicals are compared to numerical screening values. If the

maximum concentration of a chemical is above a screening value, the chemical is considered a COPC for the site. Generally, at sites where contaminant concentrations fall below screening levels, no further action or study is warranted for that COPC to ensure the protection of human health.

Several metrics are used for screening and selecting COPCs, including:

- Health-based screening values based on toxicological characteristics of each chemical;
- Comparison to background concentrations; and
- Evaluation of essential nutrients.

The sources of the screening levels selected for the HHRE are described below for each of the media of concern. The values for the screening levels are presented in Tables C-2 to C-5. Background concentration data were available for surface water and sediment samples, as described in the previous section, and are included in Tables C-2 to C-5 for comparison to detected concentrations.

The USEPA (1989) recommends removing chemicals from further consideration if they are considered “essential nutrients”; that is, naturally occurring chemicals essential to human life that are toxic only at very high doses. Essential nutrients are noted in Tables C-2 to C-5 and were eliminated from further consideration.

#### *Soil*

As shown in Table C-2, two primary sources of health-based screening levels are used for screening analyte concentrations reported for onsite soil. These sources include USEPA’s Regional Screening Levels for Chemical Contaminants at Superfund Sites (RSLs) (USEPA 2011a) and Washington State Model Toxics Control Act (MTCA) Method A and Method C cleanup levels generated using the online Cleanup Levels and Risk Calculations (CLARC) database (Ecology 2011b). The USEPA RSLs are risk-based concentrations derived from standard risk equations that combine default reasonable maximum exposure (RME) assumptions with USEPA toxicity data. Exposure assumptions are for a full-time (8 hours per day) worker who may work both indoors and outdoors (i.e., composite worker) and may contact chemicals in soil via incidental ingestion, dermal absorption, or particulate inhalation (USEPA 2011b). Target risk levels in the equations are set to  $1 \times 10^{-6}$  (or one in one million) for carcinogenic chemicals and a hazard index of 1 for noncarcinogens. The screening levels are considered by the USEPA to be protective for humans (including sensitive groups) over a lifetime.

With the exception of arsenic, the MTCA cleanup levels are risk-based concentrations using the equations and default parameter values set forth in the MTCA Cleanup Regulation, Chapter 173-340 WAC. The lower of the Method A and Method C values was used for the screening. Exposure assumptions for both Method A and Method C cleanup levels are for a full-time (10 hours per day) adult worker who may contact chemicals in soil via incidental ingestion (Ecology 2005) under RME conditions. Method A has an additional component in which the cleanup levels are based on concentrations that are protective of soil leaching into groundwater. MTCA cleanup levels are set to a target risk level of  $1 \times 10^{-5}$  (or one in one hundred thousand) for carcinogens and a hazard index of 1 for noncarcinogens (Ecology 2005). For arsenic in soil, the MTCA cleanup level was calculated assuming direct contact and protection of groundwater for drinking water use, then adjusted to account for natural background levels determined for Washington State (Ecology 2007).

The industrial screening levels for workers are assumed to be sufficiently conservative to be adequately protective for the shorter exposure duration and frequency of a trespasser going onsite. Therefore, scenario-specific screening levels were not calculated for the trespasser scenario; rather, the worker exposure scenario values were used.

### *Groundwater*

The health-based screening levels used for comparing groundwater concentrations are based on residential consumption of tap water because, as described in Section C.2, groundwater in the vicinity of the site is used for drinking water purposes. Three primary sources of screening levels are used in this evaluation. These sources include USEPA's RSLs for residential tap water (USEPA 2011a), USEPA Maximum Contaminant Levels (MCLs) (USEPA 2011c), and MTCA Method B cleanup levels calculated using the online CLARC database (Ecology 2011b). The USEPA RSLs are risk-based concentrations derived from standard risk equations that combine default RME assumptions with USEPA toxicity data. RSLs for tap water are based on exposure assumptions for a resident who consumes 2 liters of water per day and showers once per day. During a shower a resident may contact chemicals in the water via incidental ingestion, dermal contact, and volatile inhalation (USEPA 2011b). However, it should be noted that while the USEPA screening levels incorporate inhalation exposure in the equations, no volatiles have been detected in monitoring wells in the vicinity of the site. Target risk levels in the equations are set to  $1 \times 10^{-6}$  (or one in one million) for carcinogenic chemicals and a hazard index of 1 for noncarcinogens. The screening levels are considered by the USEPA to be protective for humans (including sensitive groups) over a lifetime.

MCLs are USEPA standards for public water systems and are developed under the National Primary Drinking Water Regulations per the Safe Drinking Water Act (SDWA). Under the SDWA, EPA sets legal limits on the levels of certain contaminants in the drinking water. The limits reflect both the level that protects human health and the level that water systems can achieve using the best available technology (USEPA 2011c).

The MTCA cleanup levels are risk-based concentrations using the equations and default parameter values set forth in the MTCA Cleanup Regulation, Chapter 173-340 WAC. Exposure assumptions are for a RME resident who may contact chemicals in groundwater via ingestion and dermal absorption (Ecology 2005). Under MTCA Method B, cleanup levels are set to a target risk level of  $1 \times 10^{-5}$  for carcinogens and a hazard index of 1 for noncarcinogens (Ecology 2005).

Screening levels for groundwater are presented in Table C-3.

### *Sediment*

Sources for sediment screening levels based on a recreational scenario are limited to the USEPA recreational RSLs, which account for either soil or sediment contact (USEPA 2011a). While the recreational RSLs are not available in USEPA generic tables as the residential and industrial RSLs are, they can be generated using the online RSL calculator. This calculator allows input of either default or site-specific exposure assumptions for incidental ingestion and dermal contact. To be efficient, the site analyte concentrations in sediment were initially compared to the soil RSLs for residential exposure (USEPA 2011a). Relying on these levels for sediment is a highly conservative approach because several exposure factors are significantly lower under the recreational scenario than they are for residential exposure. These parameters include, but are not limited to, the incidental ingestion rate, dermal contact time, and exposure frequency. If analyte concentrations exceeded the residential soil RSLs, then screening levels for recreational exposure were generated using the USEPA online RSL calculator.

Sediment concentrations were also compared to the maximum background level reported for two background samples collected upstream of the landfill. All screening values for sediment are presented in Table C-4.

### *Surface Water*

As shown in Table C-5, sources for surface water screening levels based on a recreational scenario include the USEPA RSLs and the Ambient Water Quality Criteria (AWQC) for human health. Similar to

the USEPA sediment RSLs, surface water RSLs must be generated using the online calculator and default or site-specific exposure assumptions. Exposure routes include incidental ingestion and dermal contact (USEPA 2011b). Human health AWQC are numeric values limiting the amount of chemicals present in surface water bodies and are published pursuant to the Clean Water Act (CWA). The criteria are designed to protect humans from recreational or subsistence exposure to chemicals in water and aquatic biota (e.g., fish). The values are based on the risk assessment of incidental water ingestion and consumption of aquatic organisms by individuals using a surface water body. Exposure parameters incorporated into the AWQC calculations include a water ingestion rate of 2 liters per day (L/day), a fish ingestion rate of 17.5 grams per day (g/day), a chemical-specific bioconcentration factor, and fraction of fish intake from contaminant source (USEPA 2002).

The surface water analyte concentrations were initially compared to the USEPA residential tapwater RSLs and AWQCs. If exceedances occurred, site-specific recreation surface water RSLs were calculated for the comparison. Given that fishing on Gorst Creek near the landfill site reportedly does not occur and a consumption water rate of 2 L/day for individuals recreating in the creek is highly unlikely, the screening values assumed for the surface water comparison are considered very conservative.

### **C.6 Screening Evaluation Results**

This section presents the human health screening assessment of chemical concentrations in soil, groundwater, sediment, and surface water samples using the screening levels described above and maximum detected concentrations. If the maximum concentration of a chemical is above a screening value, the chemical is considered a COPC for the site. Generally, at sites where contaminant concentrations fall below screening and/or natural background levels, no further action or study is warranted to ensure the protection of human health.

The screening evaluations for soil, groundwater, sediment, and surface water are shown in Tables C-2 to C-5, respectively. Table C-6 provides a summary of all screening level exceedances and COPCs. The results for each medium are discussed below.

#### *Soil*

Of the chemicals detected in surface soil, only chromium had concentrations exceeding screening levels (Table C-2). Chromium was detected in all seven surface soil samples collected at total concentrations ranging from 19.6 to 47.8 mg/kg, with an average of 29.6 mg/kg. All samples exceeded the USEPA RSL and MTCA CUL for hexavalent chromium assuming an industrial/worker scenario (5.6 mg/kg and 19 mg/kg, respectively) but not for trivalent chromium (1.5E+06 mg/kg and 2,000 mg/kg, respectively). Magnitude of screening level exceedances ranged from 4 to 9 times the hexavalent chromium RSL and slight to 3 times the MTCA Method A CUL (Table C-6). Current site-specific background data are not available for comparison to site concentrations.

Site-specific speciation data for chromium are not available to determine the proportions of the various forms of chromium in site soil. Therefore, the screening level comparison in this HHRE does not provide a definitive picture of the COPC status of this metal at the site. While the total chromium concentrations found at the site are comparable to typical background levels (42 mg/kg state-wide, 48 mg/kg in the Puget Sound area) and trivalent chromium is the form predominantly found in natural background soils, chromium cannot be completely ruled out as a COPC given the previous use of and disposal of chromium-related products at the landfill. Hexavalent and trivalent chromium data would be needed to resolve the uncertainty. It should be noted that, as discussed in Section C.5, the USEPA RSLs are based on a target cancer risk level of  $1 \times 10^{-6}$  (USEPA 2011b). Increasing the target risk level to  $1 \times 10^{-5}$  increases the hexavalent chromium RSL ten-fold to 56 mg/kg. The maximum detected chromium concentration is lower than this level and would not be considered a COPC when assuming this higher target risk level. The MTCA Method A CUL is already based on this higher target risk level.

The essential nutrients that were eliminated from the list of soil COPCs include magnesium, calcium, potassium, and sodium. The concentrations of these minerals in site soil samples are well below levels associated with toxicity.

#### *Groundwater*

Three metals (arsenic, chromium, and cobalt) and two volatile organic compounds (chloroform and methyl tert-butyl ether [MTBE]) were identified as human health COPCs in groundwater (Table C-3). The concentrations for all five chemicals exceeded respective USEPA RSLs for residential tap water (As 0.045 ug/L, Cr 0.043 ug/L, Co 4.7 ug/L, chloroform 0.19 ug/L, and MTBE 12 ug/L) in the one sample collected in 2011 (Table C-3). The arsenic concentration was 44 times its RSL, chromium was over 300 times its RSL, and MTBE was 5 times its RSL (Table C-6). The concentrations for these three chemicals were 2 ug/L, 14.5 ug/L, and 55 ug/L, respectively. For chloroform (0.43 ug/L), the exceedance was slightly greater than two times and for cobalt only slightly higher (site concentration of 5.1 ug/L). In addition, the arsenic concentration (2 ug/L) was nearly two times the MTCA Method B cleanup level for a residential scenario. However, with the exception of cobalt and MTBE, which have no promulgated national standards, all chemical concentrations were well below the respective USEPA MCLs (Table C-3).

For MTBE, USEPA provides a drinking water health advisory range of 20 to 40 ug/L to prevent adverse taste and odor in the water (USEPA 1997). Studies have shown that concentrations in this range are several orders of magnitude lower than the range of exposure levels in which adverse health effects were observed in rodents (USEPA 1997). Advisories are for communities concerned with potential risk from exposure to chemicals for which no national regulations currently exist. Advisories are used only for guidance and are not mandatory standards for action. The MTBE concentration in groundwater (55 ug/L) was slightly above the upper end of the advisory range. Cobalt has no such advisory published.

Current background data for groundwater were not available for comparison. The essential nutrients that were eliminated from the list of groundwater COPCs include calcium, magnesium, potassium, and sodium. The concentrations of these minerals in site groundwater samples are well below levels associated with toxicity.

#### *Sediment*

Metals, PCBs, and VOCs were detected in the two sediment samples collected downstream of the site. With the exception of arsenic and the PCBs (Aroclor 1248, Aroclor 1254, and Aroclor 1260), concentrations of all detected analytes were below the USEPA RSLs for a residential scenario (Table C-4). The arsenic concentrations of 1.11 mg/kg and 1.73 mg/kg in the sediment samples exceeded the residential RSL by 3 to 4 times (0.39 mg/kg). However, these concentrations were below the site-specific background concentration of 2.42 mg/kg). The maximum Aroclor concentrations, ranging from 516 to 908 ug/kg, exceeded the Aroclor residential RSL by 2 to 4 times, as well as the site-specific background concentrations (Table C-6). However, USEPA's online RSL calculator generated recreational screening levels 10 times greater than those for the residential scenario by assuming a reduced exposure frequency of 35 days/year rather than 365 days/year (Table C-4). The lower value represents a RME number of days an individual might recreate in Gorst Creek given the maritime climate typical of Kitsap County (i.e., 7 days per month for 5 months). The arsenic sediment concentrations are 2 to 3 times lower than the recreational RSL. Similarly, the Aroclor sediment concentrations are 2 to 4 times lower than respective recreational RSLs. Therefore, arsenic and the Aroclors are not considered human health COPCs in sediment.

While several other chemicals in the downstream samples were detected above background levels, the concentrations of these chemicals were all well below screening levels (see Table C-4). No human health COPCs were identified for sediment.

#### *Surface Water*

Three metals (iron, manganese, and zinc) and one essential nutrient (calcium) were detected in the two surface water samples collected downstream of the site in 2003 (Table C-5). Concentrations of these metals were well below the respective USEPA residential tapwater RSLs and AWQC. Zinc was only slightly above the background level, and both iron and manganese were below background levels. Therefore, no COPCs in surface water for human health concerns were identified.

### **C.7 Uncertainties**

Uncertainty is inherent in every step of the risk evaluation process. Significant sources of uncertainty in the HHRE include the following:

- The standard methodology for risk assessment relies on fixed input parameters in the equations used to calculate risk estimates, cleanup levels, or screening levels. These parameters are based on a considerable number of assumptions and do not characterize the variability inherent in a population or in environmental media concentrations.
- Screening criteria are based on published screening levels or standards, both of which tend to rely on conservative default assumptions. These assumptions are selected to represent a high-end estimate of exposure for an individual (i.e., RME) that is a conservative, or protective, estimate of actual exposures. Potential exposures may be less than estimated.
- The HHRE relied on maximum concentrations for comparison to screening levels due to the streamlined nature of the evaluation and the limited number of available data points. In the case of groundwater, the results for only one recent sample were available for screening. Not knowing the variability and distribution of concentrations within different areas of the groundwater introduces significant uncertainty in the screening results. Similarly, the sediment data set was limited to two samples and, while there were no exceedances, the small sample size introduces uncertainty into these results.
- For the HHRE, a conservative assumption was made that all of the chromium detected in surface soil samples was in the hexavalent form, which is considered carcinogenic. However, most of the chromium is likely to be in the trivalent form which is not carcinogenic and has a higher RSL. Speciation data to determine amounts of each form were not available.
- Surface water was not sampled in 2011 due to low water levels in the vicinity of the site. Therefore, the screening evaluation relied upon historical data which may not accurately reflect current conditions in Gorst Creek.
- The lack of background data for comparing to groundwater concentrations could lead to an assumption that screening level exceedances are due entirely to the landfill site. Given that the site is located in an industrial and commercial area, sources other than the landfill site are likely to be present.

## C.8 HHRE Summary

The HHRE is a streamlined evaluation in which COPCs for the landfill site were identified by comparing site concentrations to screening levels. Screening levels included USEPA published and calculated risk-based concentrations, Washington State cleanup levels, and applicable standards.

Exposure scenarios evaluated in the HHRE include current and future residential, current and future worker, current and future trespasser, and current and future recreational. Human receptors at the Gorst Creek Landfill site could be exposed to chemicals through contact with surface soil, groundwater, sediment, and surface water. Routes of exposure include ingestion, dermal absorption, and inhalation. Screening levels were selected to be consistent with these exposure scenarios.

Screening levels were compared to maximum detected concentrations reported for surface soil, groundwater, and sediment samples collected in July and August 2011. Surface water samples were not collected at this time due to lack of water flow; therefore, historical data from 2003 were used in the HHRE. If the maximum concentration of a chemical was above a screening value, the chemical was considered a COPC for the site. Generally, at sites where contaminant concentrations fall below screening and/or natural background levels, no further action or study is warranted to ensure the protection of human health for that compound. Results of the screening level comparison are summarized in Table C-6 and are described as follows:

- The total chromium concentrations in all seven surface soil samples exceeded the USEPA industrial worker RSL for hexavalent chromium based on a cancer target risk level of  $1 \times 10^{-6}$ ; however, none of the total chromium concentrations exceeded the RSL for trivalent chromium. Trivalent chromium is the predominant form of chromium typically found in soil and the total chromium concentrations found are comparable to typical background levels. Modifying the target risk level to  $1 \times 10^{-5}$  in the RSL calculation results in no chromium exceedances of the hexavalent chromium RSL. It should be noted that Washington state MTCA cleanup levels assume a  $1 \times 10^{-5}$  target risk level in the calculations. Chromium is nominally a COPC for soil because no chromium speciation data is available and the total chromium concentrations exceed the RSL for hexavalent chromium. However, for the reasons stated, it is unlikely that chromium is actually a site-related COPC. No other chemicals in soil exceeded screening levels.
- Arsenic, chromium, cobalt, chloroform, and MTBE concentrations exceeded respective USEPA RSLs for residential tap water in the one sample collected in 2011. Arsenic also exceeded the MTCA Method B drinking water cleanup level. However, with the exception of cobalt and MTBE, which have no promulgated national standards, the other chemicals had concentrations that were well below the respective MCLs. The MTBE concentration is only slightly above USEPA's drinking water advisory concentration range. This range is only for guidance and not mandatory regulation. Cobalt has no such advisory.
- All chemicals detected in sediment and historical surface water samples had site concentrations below applicable screening levels.

<sup>a</sup>Includes only analytes detected at least once in soil samples; bold type indicates chemical is a COPC

<sup>b</sup>In the absence of speciated site data for chromium RSL and MTCA CUL are for hexavalent chromium (Cr VI) (see text). The RSL and MTCA CUL for trivalent chromium (Cr III) are 1.5E+06 mg/kg and 2,000 mg/kg, respectively.

<sup>c</sup>No specific screening levels are available for this chemical; therefore, the screening level for toluene was used as a substitute.

Key:

NA = not available

COPC = chemical of potential concern

CUL = cleanup level

FoD = frequency of detection (number of detects over total number of samples)

FoE = frequency of exceedence (number of samples that exceed screening level over total number of samples)

HPAH = high molecular weight PAH

LPAH = low molecular weight PAH

mg/kg = milligrams per kilogram

MTCA = Model Toxics Control Act (value is the lowest of Methods A and C)

NUT = considered essential nutrient for humans

PAH = polycyclic aromatic hydrocarbon

RSL = regional screening level

µg/kg = micrograms per kilogram

USEPA = United States Environmental Protection Agency

? = status as COPC uncertain

-- = not applicable

**Table C-3. Groundwater Human Health Screening Results for Samples Collected in August 2011, Gorst Creek - Bremerton Auto Wrecking Landfill.**

<sup>a</sup>Includes only analytes detected at least once in groundwater sample

<sup>b</sup>In the absence of speciated chromium data, RSL and MTCA CUL are for hexavalent chromium (Cr VI) (see text); MCL is for total chromium. Chromium III screening levels are 55,000 ug/L (RSL resident tap) and 24,000 ug/L (MTCA Method B).

-- = Not applicable  
COPC = chemical of potential concern  
CUL = cleanup level  
FoE = frequency of exceedence (number of samples that exceed screening level over total number of samples)  
MCL = maximum contaminant level  
MTCA = Model Toxics Control Act  
NA = Not available  
NUT = essential nutrient for humans  
µg/L = micrograms per liter  
RSL = Regional Screening Level  
USEPA = United States Environmental Protection Agency

<sup>a</sup>Includes only analytes detected at least once in sediment samples

<sup>b</sup>USEPA recreational (Rec) RSL was calculated only for analytes with sediment concentrations that exceeded the USEPA Residential RSL; the Rec RSL was calculated assuming an exposure frequency (EF) of 35 days/year or 1/10 of the residential EF (see text).

<sup>c</sup>No specific screening levels are available for this chemical; therefore, the screening level for toluene was used as a substitute.

Key:

-- = Not applicable

Bckgrd = background level

COPC = chemical of potential concern

FoE = frequency of exceedence (number of samples that exceed screening level over total number of samples)

mg/kg = milligrams per kilogram

NA = Not available

ND = Non-detect

NUT = essential nutrient for humans

Rec = recreational

Res = residential

µg/kg = micrograms per kilogram

USEPA RSL = United States Environmental Protection Agency Regional Screening Level

## **Appendix B -- Streamlined Ecological Risk Evaluation**

### **D.1 Introduction**

This section presents a streamlined ecological risk evaluation for the Gorst Creek – Bremerton Auto Wrecking Landfill and portion of Gorst Creek near the landfill. The evaluation was undertaken to determine if contaminant concentrations in environmental media at and near the site pose an ecological risk and, if so, to aid in making risk-management decisions.

The methodology used in the streamlined ecological risk evaluation was generally consistent with United States Environmental Protection Agency (USEPA) and Washington State Department of Ecology (Ecology) guidance, including, but not limited to:

- *Guidance on Conducting Non-Time-Critical Removal Actions Under CERCLA* (USEPA 1993a)
- *Ecological Risk Assessment Guidance for Superfund: Process for Designing and Conducting Ecological Risk Assessments* (USEPA 1997);
- *Guidelines for Ecological Risk Assessment* (USEPA 1998);
- *Wildlife Exposure Factors Handbook* (USEPA 1993b);
- *Guidance for Developing Ecological Soil Screening Levels* (USEPA 2005a); and
- *Model Toxics Control Act Chapter 70.105D RCW and Cleanup Regulation Chapter 173-340 WAC* (Ecology 2007).

In addition to the above mentioned state and federal guidance documents, E & E also used publications from Oak Ridge National Laboratory (ORNL) and articles from the peer-reviewed literature, as appropriate.

The remainder of this section is organized as follows:

- Section D.2 provides a brief site description.
- Section D.3 presents the problem formulation for the streamlined ecological risk evaluation.
- Sections D.4 compares chemical concentrations in sediment and soil with risk-based screening levels for benthic invertebrates, terrestrial vegetation, soil invertebrates, and wildlife; presents the results of toxicity tests conducted with Gorst Creek sediment; and presents a supplemental risk evaluation for wildlife.
- Section D.5 identifies and discusses sources of uncertainty in the risk evaluation.
- Section D.6 presents a summary of the risk evaluation.

### **D.2 Site Description**

#### **D.2.1 Summary of Site History and Characteristics**

The Gorst Creek – Bremerton Auto Wrecking Landfill is a closed landfill located in Kitsap County, Washington approximately 5 miles southwest of Port Orchard, 6 miles south-southwest of Bremerton, and

1.5 miles west of Gorst, Washington along the southwest side of Highway 3 (see Figure 1-1 for site location figure). The property began operating as a landfill in 1950 under the name of Ames Auto Wrecking. Beginning in 1980, the landfill operated under the name of Bremerton Auto Wrecking, Inc. until its closure in 1989 by the Kitsap County Health Department as a result of non-compliance with state and local solid-waste regulations. In addition to automotive debris, the landfill accepted waste from public dumping, occasional demolition debris contracts, and refuse from the Puget Sound Naval Shipyard, including a limited amount of medical waste from that facility (E & E 2003).

The landfill is a triangular-shaped parcel of 5.7 acres centered over 700 feet of the Gorst Creek ravine. The ravine was 60 to 80 feet deep at this location before being used as a landfill. Gorst Creek is located in the ravine and is conveyed under the landfill through a culvert that was constructed when landfill operations began in 1968. Presently, the top of the landfill is flush with the surrounding topography over much of the landfill surface and is overgrown with saplings, blackberry bushes, and other vegetation. The invasive Himalayan blackberry (*Rubus armeniacus* or *R. discolor*) is the predominant plant species on the landfill surface.

Gorst Creek is an intermittent stream in the site vicinity. During field work in July 2011, no surface water was present in the creek near the site. Downstream from the site, Gorst Creek becomes a perennial stream and flows for 3.7 miles to Sinclair Inlet, an arm of Puget Sound.

Additional information about site conditions and current and past use of the site is provided in Sections 1.2 and 1.3).

#### **D.2.2 Species of Special Concern**

E & E examined available information from the Washington Department of Fish and Wildlife (WDFW), Washington State Department of Natural Resources (WSDNR), United States Fish and Wildlife Service (USFWS), and National Oceanic and Atmospheric Administration (NOAA) regarding the presence of sensitive plant and animal species in the site vicinity. A summary of the information from these agencies is provided below.

The WDFW Priority Habitats and Species (PHS) database (WDFW 2011) indicated that the Coho salmon (*Oncorhynchus kisutch*, federally listed threatened) and coast-resident cutthroat trout (*O. clarki*, PHS listed) occur or migrate in Gorst Creek. The information in the PHS database suggests that these species may occur throughout Gorst Creek, including the portion of the creek near the site.

The WSDNR (2011) indicated that six rare plants species occur in Kitsap County: pink sand-verbena (*Abronia umbrellata* var. *brevifolia*, state-listed endangered); Vancouver ground-cone (*Boschniakia hookeri*, state-listed of potential concern); bog clubmoss (*Lycopodium inundata*, state-listed sensitive); western yellow oxalis (*Oxalis suksdorfii*, state-listed threatened); humped bladderwort (*Utricularia gibba*; state-listed of potential concern); and chain fern (*Woodwardia fimbriata*; state-listed sensitive). The Vancouver ground-cone, bog clubmoss, humped bladderwort, and chain fern were sited in west Kitsap County within approximately 10 miles of the site. However, none of these species were observed at the site during field activities in July 2011 and they would not be expected to occur there given their habitat requirements. Vancouver ground pine is a root parasite and typically is found growing in young forest stands near salt water. Associated tree species include western hemlock, western red cedar, Sitka spruce, and Douglas fir. Bog clubmoss, humped bladderwort, and chain fern prefer perennially wet habitats (bogs, lakeshores, etc.) that are not offered by the site.

The USFWS (2010) indicated that the bull trout (*Salvelinus confluentus*) – Coastal-Puget Sound Distinct Population Segment (DPS) and marbled murrelet (*Brachyramphus marmoratus*) are listed as threatened and endangered species, respectively, in Kitsap County. Also, the USFWS considers the yellow-billed

cuckoo (*Coccyzus americanus*) as a candidate species in Kitsap County and 12 other animals as species of concern in Kitsap County, including: bald eagle (*Haliaeetus leucocephalus*), long-eared myotis (*Myotis evotis*), long-legged myotis (*Myotis volans*), northern goshawk (*Accipiter gentilis*), northern sea otter (*Enhydra lutris kenyoni*), northwestern pond turtle (*Emys* (= *Clemmys*) *marmorata marmorata*), Pacific lamprey (*Lampetra tridentata*), Pacific Townsend's big-eared bat (*Corynorhinus townsendii townsendii*), peregrine falcon (*Falco peregrinus*), river lamprey (*Lampetra ayresi*), tailed frog (*Ascaphus truei*), and western toad (*Bufo boreas*). Some of these species (e.g., marbled murrelet, northern sea otter, and peregrine falcon) would not be expected to occur in the site vicinity given their habitat requirements. However, the possibility that the other mentioned-above species might occur in the site vicinity cannot be definitely ruled out, although none were observed during field work at the site in July 2011.

The National Marine Fisheries Service, a branch of NOAA, identified the Puget Sound Chinook salmon (*O. tshawytscha*) evolutionarily significant unit (ESU) and Puget Sound steelhead (*O. mykiss*) DPS as federally threatened species in Puget Sound (NOAA 2011). Because Gorst Creek is a tributary of Puget Sound, the occurrence of these species in Gorst Creek cannot be definitely ruled out.

### **D.3 Problem Formulation**

Problem formulation is the first step in the ecological risk assessment process and identifies the goals, breadth, and focus of the assessment (USEPA 1997, 1998). The problem formulation step identifies site-related contaminants (i.e., stressors), potential ecological receptors, and potential exposure pathways. A conceptual model is then developed to summarize the relationship between stressors and receptors. Lastly, assessment endpoints and measures (previously called measurement endpoints) are developed to guide the remaining steps of the risk assessment process. The problem formulation and conceptual site model (CSM) for the Gorst Creek – Bremerton Auto Wrecking Landfill site are presented below.

#### **D.3.1 Contaminant Sources and Migration Pathways**

In addition to automotive debris, the Gorst Creek – Bremerton Auto Wrecking Landfill accepted waste from public dumping, occasional demolition debris contracts, and refuse from the Puget Sound Naval Shipyard, including a limited amount of medical waste from that facility (E & E 2003). The landfill is estimated to contain 150,000 cubic yards of waste (E & E 2003, 2004) from these sources. The landfill is not capped. In March 1997, after a significant storm event (7.3 inches in a 24-hour period), Gorst Creek backed up on the upstream side of the landfill and overtopped the surface of the landfill, causing a portion of the northwest slope of the landfill to fail and wash into Gorst Creek. In January 2002, after another significant storm event, Gorst Creek again backed up and overtopped the landfill, resulting in another (smaller) slope failure. Landfill debris was again released to Gorst Creek. Other less significant releases may have taken place over the past 15 years. Gorst Creek backs up behind the landfill during periods of heavy precipitation because a portion of the culvert beneath the landfill has collapsed (E & E 2004).

#### **D.3.2 Site-Related Chemicals**

Chemicals detected in soil, sediment, and surface water in past site investigations included metals, volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), polychlorinated biphenyls (PCBs), and pesticides (E & E 2003, 2004). Based on these investigations, DDT, DDE, and PCBs (Aroclor 1254) in sediment in Gorst Creek downstream from the site appeared to be of greatest concern from an ecological standpoint; sediment concentrations of these chemicals exceeded their respective probable effect concentration (PEC, MacDonald et al. 2000), indicating that the concentrations were great enough to adversely effect benthic invertebrates. These chemicals also were detected in surface and subsurface soil from the site, suggesting that the landfill is a source to the creek.

#### **D.3.3 Ecological Receptors**

The following ecological receptor groups have the potential to be affected by site-related contaminants at the site:

- Terrestrial plants and soil invertebrates living on the landfill surface;
- Mammals, birds, and reptiles that use the landfill surface and Gorst Creek near the landfill to satisfy their food and habitat needs; and
- Benthic invertebrates, fish, amphibians, and other aquatic organisms in Gorst Creek near the landfill.

### **D.3.4 Ecological Conceptual Site Model**

Potential receptors and exposure pathways are summarized in the site conceptual model shown in Figure 1-6. Terrestrial plants and soil invertebrates on the landfill surface may be exposed to site-related chemicals by direct contact with contaminated soil. Birds, mammals, and reptiles that use the site may be exposed to site-related chemicals by incidental ingestion of contaminated soil, consumption of contaminated prey, and consumption of contaminated water. Direct contact with contaminated media also is a potential exposure pathway for wildlife, but is considered insignificant due to the protection provided by their external coverings (i.e., fur, feathers, and scales). Amphibians, benthic invertebrates, and fish in Gorst Creek near the site may be affected by direct contact with contaminated water and sediment, ingestion of contaminated water and sediment, and through the food chain, although not all of these exposure pathways are equally significant. Direct contact with sediment typically is considered a minor exposure pathway for fish, amphibians, and many other aquatic organisms (e.g., zooplankton and phytoplankton).

### **D.3.5 Assessment Endpoints and Measures**

Assessment endpoints are expressions of the ecological resources that are to be protected (USEPA 1997). An assessment endpoint consists of an ecological entity and a characteristic of the entity that is important to protect. According to USEPA (1998), assessment endpoints do not represent a desired achievement or goal, and should not contain words such as protect or restore, or indicate a direction for change such as loss or increase. Assessment endpoints are distinguished from management goals by their neutrality (USEPA 1998).

Measurements used to evaluate risks to the assessment endpoints are termed “measures” and may include measures of effect (e.g., results of sediment toxicity tests), measures of exposure (e.g., chemical concentrations in soil) and/or measures of ecosystem and receptor characteristics (e.g., habitat characteristics or water quality conditions) (USEPA 1998). Based on the site ecology, potential site-related contaminants, and preliminary conceptual model, the ecological resources potentially at risk at the site include populations of plants, soil invertebrates, mammals, birds, reptiles, fish, amphibians, and benthic invertebrates that use the landfill surface and/or Gorst Creek near the landfill. The assessment endpoints and measures for these receptor groups are listed in Table D-1.

### **D.3.6 Data Used in Risk Evaluation**

The streamlined ecological risk evaluation is based on soil and sediment data collected in July 2011. In July 2011, seven surface soil samples (LF01SS to LF07SS) were collected from the landfill surface and four sediment samples (GC01SD to GC04SD) were collected from Gorst Creek near the landfill. Two sediment samples (GC01CD and GC02SD) were collected upstream from the landfill and two sediment samples (GC03SD and GC04SD) were collected downstream from the landfill. Sample location maps are provided in Section 1.4.2 and E & E (2011). The samples were analyzed for metals, VOCs, SVOCs, PCBs, and pesticides. In addition, sediment samples were analyzed for toxicity to benthic invertebrates using USEPA (2000) and ASTM (1993) protocols. Surface water samples were not collected in July 2011 because the creek was dry in the site vicinity at that time. Historical data from Hart Crowser (2000)

and E & E (2004) were deemed to not reflect current site conditions and therefore were not used in the ecological risk evaluation.

#### **D.4 Ecological Risk Evaluation**

The ecological risk evaluation is presented under four main headings, one each for the principal assessment endpoints being evaluated: (1) benthic invertebrates; (2) terrestrial vegetation; (3) soil invertebrates; and (4) wildlife. Fish and other aquatic organisms exposed to surface water in Gorst Creek could not be evaluated in the current assessment because no surface water was present in the creek near the site at the time of sampling (July 2011).

##### **D.4.1 Benthic Macroinvertebrates**

Two approaches were used to evaluate risks to benthic macroinvertebrates in Gorst Creek (see Table D-1): (1) sediment chemical concentrations compared with screening levels for effects on freshwater benthic macroinvertebrates and (2) toxicity tests with Gorst Creek sediment. These two measures are discussed in turn below.

###### **D.4.1.1 Sediment Chemical Concentrations Compared with Screening Levels**

Chemical concentrations in Gorst Creek sediment were compared with Threshold Effect Concentrations (TECs) and Probable Effect Concentrations (PECs) from MacDonald et al. (2000). Concentrations less than the TEC are assumed to be nontoxic to benthic macroinvertebrates, while those greater than the PEC often are associated with adverse effects. Samples with chemical concentrations between the TEC and PEC are neither predicted to be toxic or nontoxic (i.e., the screening levels are not intended to provide guidance within this concentration range). If a TEC was not available for a particular chemical, an alternate screening level that was analogous to the TEC was taken from Mac Donald et al. (1999). The sediment data from July 2011 are presented and compared with screening levels in Table D-2. Aroclor 1248 and 1254 marginally exceeded the PEC in one of two sediment samples collected downstream from the landfill. No other chemicals in sediment exceeded the available PECs. Overall, the sediment screening results suggest that only levels of PCBs in sediment downstream from landfill are likely to be great enough to adversely affect benthic macroinvertebrates.

###### **D.4.1.2 Sediment Toxicity Tests**

Two different sediment bioassays were conducted with Gorst Creek sediment: (1) 10-day survival and growth test with *Chironomus dilutus* (midge) and (2) 28-day survival and growth test with *Hyalella azteca* (amphipod). The tests were conducted by Northwest Aquatic Sciences (NAS) following USEPA (2000) and ASTM (1993) protocols. Full test reports from NAS are included in Appendix A. Table D-3 provides a summary of the results. No effects on survival were observed in either test. Three samples (GC01SD, GC03SD, and GC04SD) showed reduced midge growth and two samples (GC01SD and GC03SD) showed reduced amphipod growth compared with clean control sediment. One of the samples that resulted in reduced growth was collected upstream from the landfill. The sample with the lowest midge and amphipod growth (GC03SD, see Table D-3) was collected downstream from the landfill and contained the greatest concentrations of Aroclor 1248 and 1254 (see Table D-2).

##### **D.4.2 Terrestrial Vegetation**

Potential risks to terrestrial vegetation from chemicals in soil were evaluated by comparing soil chemical concentrations with ecological soil screening levels for effects on plant survival, growth, or reproduction from USEPA (2005a, e-g, 2007a-e), Efroymson et al. (1997), or Alloway (1984). The results of the comparisons are shown in Table D-4. Copper, lead, manganese, mercury, nickel, and zinc concentrations in soil exceeded the available screening levels and therefore may be great enough to affect plant growth, reproduction, or survival in some areas of the landfill surface.

#### **D.4.3 Soil Invertebrates**

Potential risks to soil invertebrates from chemicals in soil were evaluated by comparing soil chemical concentrations with ecological soil screening levels for effects on earthworm survival, growth, or reproduction from USEPA (2005c-e, g, 2007a-e). The results of the comparisons are shown in Table D-4. Copper, manganese and zinc concentrations in soil exceeded the available screening levels and therefore may be great enough to adversely affect growth, reproduction, or survival of soil invertebrates in some areas of the landfill surface. However, both copper and manganese exceeded their respective screening level in only one sample, suggesting that potential impacts to soil invertebrates from these metals are limited in extent.

#### **D.4.4 Wildlife**

Two approaches were used to evaluate risks to wildlife at the site (see Table D-1): (1) comparing soil chemical concentrations with screening levels for effects on wildlife and (2) estimating an ingested chemical dose for comparison with a toxicity reference value (hazard quotient [HQ] method). These two measures are discussed in turn below.

##### **D.4.4.1 Surface Soil Chemical Concentrations Compared with Screening Levels**

Potential risks to terrestrial wildlife were evaluated by comparing soil chemical concentrations with ecological soil screening levels (Eco-SSLs) for effects on wildlife. Most of the available wildlife screening levels are based on exposure scenarios with wildlife species that consume soil invertebrates, such as the woodcock and shrew, but a few are based on other wildlife species. For example, the mammalian and avian Eco-SSLs for nickel are based on scenarios with a weasel (carnivore) and dove (herbivore). The results of the comparisons are shown in Table D-4. Soil concentrations of cadmium, chromium, copper, lead, zinc, DDT, and high molecular weight PAHs exceeded the available screening levels and therefore may be great enough to adversely affect growth, reproduction, or survival of wildlife on the landfill.

Unfortunately, soil screening levels for terrestrial wildlife are not available for some metals and most organic compounds. Also, sediment screening levels for effects on wildlife are not available. Hence, comparing chemical concentrations with screening levels does not provide a complete assessment of potential wildlife risks. To address this shortcoming, screening-level exposure estimates and HQs were calculated for four representative wildlife species using maximum detected concentrations of chemicals in surface soil and sediment. Details are provided in the following section.

##### **D.4.4.2 Wildlife Risk Evaluation**

This section presents an evaluation of potential risks to wildlife at the Gorst Creek – Bremerton Auto Wrecking site. The evaluation was performed in accordance with state, federal, and other available guidance for ecological risk assessment (e.g., USEPA 1997, 1998, 2005a; Sample *et al.* 1996). The wildlife risk evaluation consists of three parts: (1) exposure assessment, (2) ecological effects assessment, and (3) risk characterization. The exposure assessment estimates wildlife exposure to site-related chemicals using measured concentrations of chemicals in environmental media and exposure parameters for the chosen receptor species. The ecological effects assessment summarizes the potential toxic effects of site-related chemicals on wildlife by selecting a toxicity reference value for each chemical for each receptor. The risk characterization combines the results of the exposure and ecological effects assessments to provide an estimate of potential risk to wildlife at the site.

###### **D.4.4.2.1 Exposure Assessment**

This section discusses potential wildlife exposures to chemicals at the site. Potential receptors and exposure pathways were generally discussed in Section D.3.3 and identified in the ecological conceptual site model (see Figure 1-6). This section describes specific wildlife exposure scenarios that will be

evaluated in the assessment; estimates of concentrations of chemicals in soil, sediment, and prey; and quantifies exposure.

#### **D.4.4.2.1.1 Wildlife Exposure Scenarios and Pathways**

Four wildlife species representing different functional groups were selected as receptors for the assessment: (1) American robin (*Turdus migratorius*); (2) masked shrew (*Sorex cinereus*); (3) barn swallow (*Hirundo rustica*); (4) raccoon (*Procyon lotor*). The robin and shrew have relatively small home ranges and could derive a large portion of their food and habitat requirements from the site. In addition, both the robin and shrew feed extensively on soil invertebrates, such as earthworms, and therefore are often highly exposed to contaminants in soil. The raccoon is an omnivorous mammal that often forages in aquatic habitats. Given its foraging behavior, the raccoon is likely to use Gorst Creek near the landfill, where it may be exposed to site-related chemicals in water, sediment, and prey. Lastly, the barn swallow is an insectivorous songbird that readily consumes emergent aquatic insects in riparian settings. The barn swallow also may be exposed to chemicals in sediment while collecting mud for nest building.

For these four wildlife receptors, this assessment evaluates exposure from incidental ingestion of contaminated soil or sediment and consumption of contaminated prey. Exposure through drinking was not quantitatively evaluated because consumption of surface water typically accounts for only a small fraction of the total chemical exposure for wildlife. This results from the fact that chemicals occur in soil, sediment, and biota at much greater concentrations (part per million concentration range) than in surface water (part per billion concentration range). Direct contact with contaminated media is considered an insignificant route of exposure for wildlife due to the protection provided by fur and feathers and therefore was not quantitatively evaluated. A summary of important life-history characteristics of the chosen receptor species is provided below.

**American Robin** – The American robin is a common resident of open areas, woodland edges, and early successional habitats (USEPA 1993b). The makeup of the diet varies seasonally, with invertebrates making up the majority of food items during the spring and early summer. During this time, robins feed on the ground, searching the soil and leaf litter for invertebrates, such as earthworms. Robins establish small territories during the breeding season, and potentially could reside entirely within the area provided by the site. Northern populations typically winter in southern locations.

**Masked Shrew** – The masked shrew is the most common shrew in moist forests, open country, and brush in the northern United States and throughout Canada and Alaska (USEPA 1993b). It feeds primarily on invertebrates, including insects, earthworms, slugs, and snails. Vertebrates and plants typically make up a minor component of the diet. The species is active year-round. Shrews have a small home range (USEPA 1993b); therefore, the masked shrew could reside entirely within the area provided by the site.

**Raccoon** – The raccoon is the most abundant and widespread medium-sized omnivore in North America. Raccoons are found near virtually every aquatic habitat (USEPA 1993b). They also are common in suburban residential areas and cultivated and abandoned farmlands. Raccoons use surface water bodies for both drinking and foraging. The raccoon is an omnivore and opportunistic feeder. They feed primarily on fleshy fruits, nuts, acorns, and corn, but also eat grain, insects, frogs, crayfish, eggs, and virtually any animal and vegetable matter. The proportion of the diet depends on location and season, although plant material is usually a more important component of the diet than animal material. Typically, it is only in the spring and early summer that raccoons eat more animal than plant material. The size of a raccoon's home range depends on several factors, including its sex and age, habitat quality, food sources, and season. Values from a few hectares to more than a few thousand hectares have been reported, although home ranges of several hundred hectares appear to be most common (USEPA 1993b). Raccoons may forage in Gorst Creek near the site.

**Barn Swallow** – The barn swallow is an insectivorous songbird that readily consumes emergent aquatic insects in stream and lake settings (Bent 1963). The barn swallow was conservatively assumed to feed entirely on emergent (adult forms) of aquatic insects from Gorst Creek. Barn swallows also could be exposed to chemicals in creek sediment while collecting mud for nest building. Barn swallows reside in the Puget Sound area from mid-April to mid-October (Wahl 1995).

#### **D.4.4.2.1.2 Wildlife Exposure Calculations**

The total chemical exposure for wildlife was calculated as the sum of exposures from diet and incidental soil or sediment ingestion. As noted above, chemical exposure from surface-water consumption was not quantitatively evaluated. Dietary exposure is calculated by multiplying the chemical concentration in each food item by its fraction of the total diet and summing the contribution from each item. This sum is then multiplied by the receptor's site use factor (SUF), exposure duration (ED), and ingestion rate (IR), and divided by the receptor's body weight (BW), as shown in the following equation:

$$EE_{\text{diet}} = [(C_1 \times F_1) + (C_2 \times F_2) + \dots (C_n \times F_n)] \times \text{SUF} \times \text{ED} \times \text{IR} / \text{BW}$$

where:

$EE_{\text{diet}}$  = Estimated exposure from diet (mg/kg-day);

$C_n$  = Chemical concentration in food item  $n$  (mg/kg dry weight);

$F_n$  = Fraction of diet represented by food item  $n$ ;

SUF = Site use factor (unitless);

ED = Exposure duration (unitless), equal to fraction of year spent at site;

IR = Ingestion rate of receptor (kg/day dry weight); and

BW = Body weight of receptor (kg).

The site use factor (SUF) indicates the portion of an animal's home range represented by the site. If the home range is larger than the site, the SUF equals the site area divided by the home range area. If the site area is greater than or equal to the home range, the SUF is equal to 1. Exposure duration (ED) is the percentage of the year spent in the site area by the receptor species. Home-range size, IR, and BW for the robin, shrew, swallow, and raccoon were taken from USEPA (1993b), Sample and Suter (1994), and Sample *et al.* (1996). The values are presented in Table X-5. Critical exposure assumptions are described in the following section.

Wildlife exposure to chemicals through incidental ingestion of soil/sediment is estimated in a manner similar to dietary exposure. Specifically, the soil/sediment chemical concentration is multiplied by the soil/sediment IR and then multiplied by the SUF and ED and divided by BW. Soil/sediment ingestion estimates for the receptor species were taken from Sample and Suter (1994), Sample *et al.* (1996), and Beyer *et al.* (1994). The values are presented in Table X-5.

The total exposure for a receptor is the sum of exposure from diet and soil/sediment ingestion, as represented by the following equation:

$$EE_{\text{total}} = EE_{\text{diet}} + EE_{\text{soil/sediment}}$$

where:

$EE_{\text{total}}$  = Total exposure (mg/kg-day);

$EE_{\text{diet}}$  = Estimated exposure from diet (mg/kg-day);

$EE_{\text{soil/sediment}}$  = Estimated exposure from soil/sediment ingestion (mg/kg-day).

#### **D.4.4.2.1.3 Screening-Level Exposure Assumptions**

**Diet** -- The robin and shrew were conservatively assumed to prey entirely on earthworms. Earthworms were chosen as a representative prey item for these receptors because earthworms typically are abundant in surface soil, are important in the diets of shrews and robins, and have been well studied compared with other groups of soil invertebrates. The diet of the swallow was conservatively assumed to consist entirely of emergent aquatic insects from Gorst Creek. Swallows often prey on midges, mayflies, and other emergent aquatic insects. The diet of the raccoon was conservatively assumed to consist entirely of crayfish from Gorst Creek. Crayfish were chosen as a representative aquatic prey species for the raccoon because they typically are abundant in small streams and are readily eaten by raccoons (USEPA 1993b). Table D-5 summarizes the assumed diets. Contaminant levels in earthworms, benthic invertebrates, and crayfish were estimated as described below.

**Site Use Factor (SUF) and Exposure Duration (ED)** -- To provide a conservative estimate of exposure to site-related chemicals, the SUF and ED were assumed to be 1 for all receptors. That is, the site was assumed to be a closed system and the shrew, robin, swallow, and raccoon were assumed to derive all of their food and habitat requirements from the landfill or Gorst Creek near the landfill. For this assessment, the robin and shrew were assumed to forage exclusively on the landfill surface and the swallow and raccoon were assumed to forage exclusively along Gorst Creek near the landfill. These assumptions are highly conservative and often are used in screening-level risk calculations to avoid overlooking chemicals that may be of concern for wildlife (USEPA 1997).

#### **D.4.4.2.1.4 Exposure Point Concentrations**

**Soil** -- Maximum surface soil chemical concentrations were used as the exposure point concentrations (EPCs) to estimate exposure for the robin and shrew. The soil EPCs were used for two purposes: (1) to estimate exposure from incidental soil ingestion; and (2) to model chemical concentrations in earthworms, the assumed prey for the shrew and robin. Soil EPCs are listed in Table D-6.

**Earthworms** -- Chemical concentrations in earthworms were modeled from the soil EPCs using soil-to-earthworm bioaccumulation factors (BAFs) and uptake equations from USEPA (2005a) and Sample *et al.* (1998). If a BAF or uptake equation was not available, a soil-to-earthworm uptake factor of 1 was assumed (i.e., earthworm chemical concentration was set equal to the soil chemical concentration). Table D-6 lists the soil-to-earthworm uptake factors and equations and earthworm EPCs used in the assessment.

**Sediment** -- The maximum detected concentration was used to estimate wildlife exposure to chemicals in sediment. The sediment EPCs were used for two purposes: (1) to estimate exposure from incidental sediment ingestion for the swallow and raccoon; and (2) to model chemical concentrations in benthic invertebrates and crayfish, the assumed prey of the swallow and raccoon, respectively. Sediment EPCs are listed in Table D-7.

**Benthic Invertebrates** -- Chemical concentrations in benthic invertebrates, including crayfish, were modeled from the sediment EPC using biota-sediment accumulation factor (BSAFs) and equations developed by Bechtel Jacobs (1998). For metals not addressed by Bechtel Jacobs (1998), a BSAF of 1 was assumed (i.e., the prey chemical concentration was set equal to the sediment EPC). The benthic invertebrate EPCs are listed in Table D-7.

#### **D.4.4.2.2 Ecological Effects Assessment**

No observed adverse effect levels (NOAELs) and lowest observed adverse effect levels (LOAELs) for chemicals of interest were taken from USEPA (2008, 2007a to g, 2005b to f) and Sample *et al.* (1996). The values and sources are listed in Table D-8. The NOAELs and LOAELs were not scaled for

differences in body weight between the test species and wildlife receptors being evaluated because this practice is no longer considered appropriate (Allard et al. 2009). Therefore, information on test-species body weight is not included in Table D-8.

#### **D.4.4.2.3 Wildlife Risk Characterization**

The potential risks posed by site-related chemicals were determined by calculating a hazard quotient (HQ) for each contaminant for each endpoint species. The HQ was determined by dividing the total exposure ( $EE_{total}$ ) by the NOAEL or LOAEL, as shown in the following equations:

$$HQ-NOAEL = EE_{total}/NOAEL$$

$$HQ-LOAEL = EE_{total}/LOAEL$$

For a given receptor and chemical, a HQ-NOAEL greater than 1 indicates that the estimated exposure exceeds the highest dose at which no adverse effect was observed. Such a result does not necessarily imply that the receptor is at risk, especially if the HQ-NOAEL is only marginally above 1. An HQ-LOAEL greater than 1 suggests that a chronic adverse affect is possible to an individual receptor, assuming that the estimated exposure for that receptor is accurate. Tables D-9 to D-12 list the estimated exposures from food and soil/sediment ingestion, total exposure, and HQs for the robin, shrew, swallow, and raccoon.

##### **D.4.4.2.3.1 Terrestrial Wildlife Risks**

Aroclor 1254, cadmium, chromium, copper, lead, nickel, and zinc were predicted to pose a potential risk to the American robin (see Table D-9). Cadmium, copper, lead, nickel and zinc were predicted to pose a potential risk to the masked shrew (see Table D-10). Lead appears to pose the greatest potential risks for both receptors based on the magnitude of the HQs (HQ-LOAEL of 20 for the American robin and 5.9 for the masked shrew).

##### **D.4.4.2.3.2 Aquatic-Dependent Wildlife Risks**

Aroclor 1248, 1254, and 1260 and copper and manganese were predicted to pose a potential risk to the barn swallow (see Table D-11). Aroclor 1248 and 1254 and manganese were predicted to pose a potential risk to the raccoon (see Table D-12). Except for the HQ-NOAELs for the Aroclors for the swallow, the HQs for the chemicals posing a potential risk to the swallow and raccoon were only marginally above 1.

As noted above, the exposure estimates and risks in Tables D-9 to D-11 are based on maximum chemical concentrations in surface soil or sediment and the assumption that all four receptors forage only at the site on a year-round basis. The following section examines the sensitivity of the exposure estimates and risks to changes in these assumptions

##### **D.4.4.2.4 Effect of Exposure Duration, Site Use Factor, and Exposure Point Concentration on Wildlife Risks**

To provide a more realistic evaluation of risks to wildlife, the SUF, ED, and EPCs were changed as follows:

- For the robin and swallow, the ED was changed from 1.0 to 0.5 to account for the migratory behavior of these species.
- For the robin and shrew, the 95% upper confidence limit (UCL) on the average chemical concentration in soil was used as the soil EPC. ProUCL Version 4 software was used to calculate UCLs for surface soil using data for the seven surface soils samples collected in July 2011. It was not possible to revise the sediment EPCs for the swallow and raccoon because only four

sediment samples were collected in July 2011, too few to support calculation of a UCL.

- For the swallow, the exposure estimates and risks were recalculated assuming that the swallow only forages on emergent aquatic insects from Gorst Creek near the site when the creek contains water, which was assumed to be 50% of the time between mid-April and mid-October.
- For the raccoon, the exposure estimates and risks were recalculated based on a more realistic SUF of 0.0003. This SUF is based on the approximate area of the Gorst Creek ravine near the site (0.2 ha) divided by the average home range size for this receptor (630 ha; USEPA 1993b).

Table D-13 illustrates the effects of these changes on the HQs for these receptors (only chemicals with HQs greater than 1 in Tables D-9 to D-12 are included in Table D-13). The following points are noteworthy:

- No chemicals are predicted to pose a risk to the raccoon when receptor-specific estimates of the SUF and ED are used.
- For the barn swallow, only Arcolor 1254 remains as a COPC; however, because the HQ-NOAEL for Aroclor 1254 is only marginally greater than 1, and because the HQ-LOAEL is much less than 1, it seems unlikely that Aroclor 1254 poses an actual risk to this receptor.
- For the American robin, cadmium, lead, and zinc remain as COPCs. However, because the HQ-NOAEL for cadmium only marginally exceeds 1, it seems unlikely that cadmium poses an actual risk to the robin.
- For the masked shrew, cadmium, lead, nickel, and zinc remain as COPCs.

The recalculated HQs in Table D-13 are referred to as “moderately conservative” because they still incorporate several conservative assumptions. For example, the recalculated HQs for the robin and shrew both assume a SUF of 1, which implies that these receptors forage only on the landfill surface. In all likelihood, these receptors probably forage more often on nearby areas with better natural habitat. Also, the recalculated HQs for the swallow and raccoon are based on maximum detected chemical concentrations in sediment because a UCL cannot be calculated from four samples, as noted above.

The final HQ results in Table D-13 (moderately conservative case) differ from the screening results for wildlife in Table D-4 in several noteworthy ways;

- The final HQ results in Table D-13 do not predict a potential risk to terrestrial wildlife from chromium, DDT, and high molecular weight PAHs in soil, whereas the screening results in Table D-4 do.
- The final HQ results in Table D-13 suggest that PCBs may be a concern for terrestrial wildlife. The screening results in Table D-4 are inconclusive for PCBs because an ecological soil screening level for PCBs for wildlife is not available.
- The final HQ results in Table D-13 suggest that aquatic-dependent wildlife (swallow and raccoon) are unlikely to be at risk from chemicals in Gorst Creek sediment. The screening results in Table D-4 are inconclusive for aquatic-dependent wildlife because sediment screening levels for effects on wildlife are not available.

In general, the HQ approach for evaluating risks to wildlife is more thorough and flexible than the simple screening approach used in Table D-4 because it allows one to examine a wider range of potential receptors, a greater number of chemicals, and the sensitivity of the risk estimates to the assumptions used. For these reasons, the wildlife risk results based on the HQ approach will be given priority over those based on simple screening when drawing conclusions about potential ecological risks to wildlife at the site.

## D.5 Uncertainties

Significant sources of uncertainty in this ecological risk assessment include the following:

- **Bioavailability** – The bioavailability of chemicals in environmental media at the site is poorly understood. To be conservative, it was assumed that 100% of the chemicals in soil and sediment were bioavailable to all ecological receptors. If bioavailability is less than 100%, which seems likely, the potential risks to all categories of ecological receptors would be correspondingly lower.
- **Reliability of Soil Benchmarks** – Many of the available soil screening benchmarks for plants and soil invertebrates (i.e. earthworms) were developed from laboratory studies in which chemical solutions were added to clean soil to arrive at a range of test concentrations. In such studies, the added chemicals are highly bioavailable. Comparing total chemical concentrations in field samples to solution-based soil benchmarks is conservative and likely results in an overestimation of risk. For aluminum, USEPA (2003) has deemed that such a comparison is inappropriate.
- **Availability of Soil Benchmarks** – As indicated in Tables D-2 and D-4, screening benchmarks are not available for all chemicals in all media. For example, soil screening benchmarks for plants and soil fauna are not available for many volatile and semivolatile organic compounds and pesticides. Hence, risks to certain receptor groups from certain chemicals could not be evaluated.
- **Chemicals in Surface Water** – Recent data for chemicals in surface water are not available because no surface water was present in Gorst Creek near the site July 2011.
- **Chemicals in Wildlife Prey** – Food-chain transfer of chemicals at the site is poorly understood. The potential risks to wildlife at the site are largely driven by estimated concentrations of chemicals in wildlife prey. For this assessment, prey concentrations were estimated from measured soil and sediment concentrations using uptake factors from the literature. Or, if a literature-based uptake factor was not available, it was assumed that the prey concentration was the same as the soil or sediment concentration. The uncertainty associated with this approach often is high because a number of site-specific factors affect food-chain transfer of chemicals. In general, the uptake factors used in this assessment are intended to provide a conservative estimate of chemicals in wildlife prey and are likely to result in an overestimation of risk.
- **Wildlife Diet** – Uncertainty may result from the assumptions made about the diets of the wildlife receptors evaluated in this assessment. For the shrew and robin, the assumption of a diet consisting entirely of earthworms is conservative. In addition to earthworms, shrews consume other invertebrates (i.e. slugs, snails, centipedes, and various insects), fungi, plant materials, and small mammals (USEPA 1993b). Similarly, robins also consume other invertebrates (i.e., spiders, sowbugs, and various insects) and plant materials (USEPA 1993b). These foods are less intimately associated with the soil matrix than earthworms, and thus accumulate lesser amounts of soil contamination. The diet assumed for the shrew and robin in this assessment likely

overestimates exposure and risks from chemicals in soil. The diet assumed for the raccoon (100% crayfish from Gorst Creek) also is highly conservative. Raccoons typically consume a considerable amount of plant material.

- **Chemical Concentrations in Environmental Media** – For sediment, the small sample size (4 samples) necessitated use of the maximum detected concentration to estimate wildlife risks. Although a larger sample size was available for surface soil (7 samples), the distribution of the data for some chemicals (e.g., lead) necessitated using the maximum detected concentration to estimate wildlife risks. Use of the maximum lead soil concentration in the wildlife risk evaluation likely resulted in an overestimate of potential risks to terrestrial wildlife from lead.

#### D.6 Summary

The assessment endpoints for this risk evaluation were stated in Table D-1 and include: terrestrial vegetation, soil invertebrates, wildlife, benthic invertebrates, and fish and other aquatic organisms exposed to surface water. Table D-14 provides a summary of the chemical that may pose a potential risk to these assessment endpoints. The following points are noteworthy.

- **Terrestrial Vegetation** – Potential risks to terrestrial plants on the landfill surface were evaluated by comparing soil chemical concentrations to screening benchmarks for effects on plant survival, growth, or reproduction. Based on these comparisons, copper, lead, manganese, mercury, nickel, and zinc in soil may pose a potential risk to terrestrial plants in some areas of the landfill surface.
- **Soil Invertebrates** – Potential risks to soil invertebrates on the landfill surface were evaluated by comparing soil chemical concentrations to screening benchmarks for effects on survival, growth, or reproduction or earthworms. Based on these comparisons, copper, manganese and zinc in soil may pose a potential risk to soil invertebrates in some areas of the landfill surface. Potential risks from copper and manganese are restricted to a single location, whereas the risks from zinc appear to be more widespread.
- **Birds and Mammals** – Based on food-chain modeling, cadmium, lead, nickel, and zinc in soil are likely to pose a risk to song birds and small mammals that feed extensively on soil invertebrates, such as the American robin and masked shrew. Risks to aquatic-dependent wildlife that may forage in Gorst Creek near the site appear to be minimal. This conclusion is based on the result that no LOAEL-based HQs exceeded the critical value of 1.0 for the swallow or raccoon.
- **Benthic Invertebrates** – Potential risks to benthic macroinvertebrates were evaluated by comparing sediment chemical concentrations with sediment screening levels and by conducting toxicity tests with Gorst Creek sediment. The sediment screening results suggest that levels of PCBs in sediment downstream from landfill are great enough to adversely affect benthic macroinvertebrates. The sediment toxicity tests found no effects on survival of laboratory-reared organisms (midge larvae and amphipods) in Gorst Creek sediment. However, three sediment samples showed reduced midge growth and two samples showed reduced amphipod growth compared with clean control sediment. The sample with the lowest midge and amphipod growth (GC03SD) contained the greatest concentrations of Aroclor 1248 and 1254. This sample was collected downstream from the landfill and upstream from Highway 3
- **Fish, Amphibian, and Other Aquatic Organisms Exposed to Surface Water** – No surface water samples were collected in July 2011 because Gorst Creek near the landfill was dry. Hence, potential risks to this assessment endpoint from site-related chemicals were not evaluated.

Overall, this evaluation identified potential risks to several ecological receptor groups using the landfill surface or Gorst Creek near the landfill. On the landfill surface, terrestrial plants, soil invertebrates, and wildlife (songbird and small mammals) may be at risk from high levels of metals in soil; cadmium, lead, nickel, and zinc pose the greatest potential risks. In Gorst Creek downstream from the landfill, sediment PCB levels are great enough to reduce growth of benthic macroinvertebrates. Birds and mammals using the creek are unlikely to be adversely affected by current levels of chemicals in sediment.

Table D-1. Assessment Endpoints and Measures for Gorst Creek - Bremerton Auto Wrecking Landfill Streamlined Ecological Risk Evaluation.

| Assessment Endpoint   | Risk Question  | Measure Selected for Streamlined Ecological Risk Evaluation   | Analysis Approach  |
|---|--|---|--|
| <b>Terrestrial Vegetation</b>   |  |   |  |
| Survival, growth, and reproduction or terrestrial plants                        | Are levels of contaminants in surface soil from the site greater than benchmarks for effects on survival, growth, or reproduction of terrestrial plants?                     | Chemical concentrations in soil.  | Compare soil chemical concentrations with literature-based toxicity thresholds.  |
| <b>Soil Invertebrates</b>   |  |   |  |
| Survival, growth, and reproduction or soil invertebrates                        | Are levels of contaminants in surface soil from the site greater than benchmarks for effects on survival, growth, or reproduction of soil invertebrates?                     | Chemical concentrations in soil.  | Compare soil chemical concentrations with literature-based toxicity thresholds.  |
| <b>Birds</b>  |  |   |  |
| Survival, growth, and reproduction or birds                                     | Are levels of contaminants in surface soil from the site greater than benchmarks for the survival, growth, or reproduction of birds?   | Chemical concentrations in soil.  | Compare soil chemical concentrations with literature-based toxicity thresholds.  |
|   | Does the daily dose of chemicals received by birds from consumption of prey and other media at the site exceed TRVs for survival, growth, or reproduction of birds?          | Chemical concentration in surface water, sediment, soil, and modeled or measured tissue concentrations in prey species. | Modeled dose from diet, surface water ingestion, and incidental ingestion of soil or sediment compared with literature-based TRVs.   |
| <b>Mammals</b>  |  |   |  |
| Survival, growth, and reproduction or mammals                                   | Are levels of contaminants in surface soil from the site greater than benchmarks for the survival, growth, or reproduction of mammals?                                       | Chemical concentrations in soil.  | Compare soil chemical concentrations with literature-based toxicity thresholds.  |
|   | Does the daily dose of chemicals received by mammals from consumption of prey and other media at the site exceed TRVs for survival, growth, or reproduction of mammals?      | Chemical concentration in surface water, sediment, soil, and modeled or measured tissue concentrations in prey species. | Modeled dose from diet, surface water ingestion, and incidental ingestion of soil or sediment compared with literature-based TRVs.   |
| <b>Reptiles</b>   |  |   |  |
| Survival, growth, and reproduction or reptiles                                  | None. Quantitative methods for evaluating the toxicity of contaminants to reptiles are poorly developed.   | None.   | None.  |
| <b>Benthic Invertebrates</b>  |  |   |  |
| Survival, growth, and reproduction or benthic invertebrates                     | Are levels of contaminants in sediment from Gorst Creek greater than sediment benchmarks for survival, growth, or reproduction of benthic invertebrates?                     | Chemical concentrations in sediment.  | Compare sediment chemical concentrations with literature-based toxicity thresholds.  |
|   | Are survival and growth of benthic invertebrates exposed to sediment downstream from the Gorst Creek landfill significantly lower than those exposed to reference sediments? | Survival and growth of benthic invertebrates in laboratory toxicity tests.  | Compare survival and growth of laboratory-reared benthic invertebrates in sediment collected upstream and downstream from the Gorst Creek Landfill. Use growth and survival tests with the freshwater amphipod ( <i>Hyalella azteca</i> ) and midge ( <i>Chironomus dilutus</i> ). |
| <b>Fish, Amphibians, and Other Aquatic Biota</b>                                |  |   |  |
| Survival, growth, and reproduction or fish, amphibians, and other aquatic biota | Are levels of contaminants in surface water from Gorst Creek greater than water quality criteria and standards for protection of aquatic life?                               | Chemical concentrations in surface water.   | Compare surface water chemical concentrations with federal and state water quality criteria and standards.   |

## Key:

-- = Not available or not applicable

ND = Non-detect

PEC = Probable effect concentration (MacDonald et al. 2000)

TEC = Threshold effect concentration (MacDonald et al. 2000)

Value = Exceeds TEC or other benchmark.

Value = Exceeds PEC. Adverse effect likely.

## Notes:

a = Detected chemicals only are listed.

b = From MacDonald et al. (1999); screening level analogous to TEC.

c = VOCs do not accumulate in sediment; hence, sediment benchmarks typically are not available for VOCs.

## Key:

-- (double dash) = not available or not applicable

COPC = chemical of potential concern

Eco-SSL = Ecological Soil Screening Level

FoD = frequency of detection (number of detects over total number of samples)

FoE = frequency of exceedance (number of samples that exceed screening level over total number of samples)

HPAH = high molecular weight PAH

LPAH = low molecular weight PAH

mg/kg = milligrams per kilogram

PAH = polycyclic aromatic hydrocarbon

µg/kg = micrograms per kilogram

? = status as COPC uncertain

Value / Value = exceeds screening value

## Notes:

a = Detected chemicals only are listed.

b = Eco-SSLs ([www.epa.gov/ecotox/ecossl/](http://www.epa.gov/ecotox/ecossl/)), except for chromium, which is from Alloway (1984), and mercury, thallium, styrene, toluene, and PCBs, which are from Efraymson et al. (1997).c = Eco-SSLs ([www.epa.gov/ecotox/ecossl/](http://www.epa.gov/ecotox/ecossl/)).

d = Rationale codes.

For Yes: SL-I = soil invertebrate screening level exceeded.

SL-P = plant screening level exceeded.

SL-W = wildlife screening level exceeded.

For No: &lt; SL = less than screening level

MSC = Major soil constituent (of low toxicity; Gough et al. 1979, USEPA 2003).

NUT = Essential nutrient (USEPA 1989).

For ? : NSL = no screening level

Table D-5. Exposure Parameters for Wildlife Species, Gorst Creek - Bremerton Auto Wrecking Landfill Site.

| Species                       | Dietary Composition |                       | Soil or Sediment Ingestion (kg/d) dry | Home Range (ha) | Fraction Soil in Dry Diet | Food Ingestion Rate (kg/d) wet | Percent Water in Diet | Food Ingestion Rate (kg/d) dry | Body Weight (kg wet) |
|-------------------------------|---------------------|-----------------------|---------------------------------------|-----------------|---------------------------|--------------------------------|-----------------------|--------------------------------|----------------------|
|                               | Earthworms          | Aquatic Invertebrates |                                       |                 |                           |                                |                       |                                |                      |

Notes:

a - Diet of 100% earthworms assumed. Home range size, food ingestion (wet), and body mass taken without modification from Sample and Suter (1994). Soil ingestion of 10.4% (of dry diet) assumed based on data from Beyer et al. (1994) for American woodcock.

b - Diet of 100% earthworms assumed. Home-range size, food ingestion (wet), and body mass are for short-tailed shrew and were taken without modification from Sample and Sutter (1994). Soil ingestion of 13% (of dry diet) based on data from Talmage and Walton (1993) as cited in Sample and Suter (1994).

c - Diet of 100% emergent aquatic insects assumed. Body weight and food ingestion from Sample et al. (1996) for rough-winged swallow ( *Stelgidopteryx serripennis* ). Soil intake assumed to be 2% of dry food ingestion. Home range of 0.5 ha assumed. Exposure duration based on observations in Wahl (1995).

d - Diet of 100% crayfish assumed. Home range and body weigh from (USEPA 1993b). Food ingestion (dry) calculated from allometric equations presented in Sample et al. (1996). Soil ingestion of 9.4% (of dry diet) based on Beyer et al. (1994).

Key:

BAF = Bioaccumulation factor

EPC = Exposure Point Concentration

HPAH = high molecular weight PAH

LPAH = low molecular weight PAH

PAH = polycyclic aromatic hydrocarbon

mg/kg = milligrams per kilogram

µg/kg = micrograms per kilogram

Notes:

a. Detected chemicals only are listed. Essential nutrients (calcium, iron, magnesium, sodium, and potassium) and major soil constituents (aluminum) were excluded from the evaluation as per USEPA guidance (USEPA 1989, 2003).

b. Soil-to-earthworm BAFs from USEPA (2005a), except for nickel, which is from Sample et al. (1998). BAF of 1 assumed for chemicals not addressed by USEPA (2005a) or Sample et al. (1998).

c. Soil-to-earthworm uptake equation from USEPA (2005a) used to calculate earthworm EPC.

Key:

BSAF = Biota Sediment Accumulation Factor

EPC = Exposure Point Concentration

mg/kg = milligrams per kilogram

µg/kg = micrograms per kilogram

Notes:

a. Detected chemicals only are listed. Essential nutrients (calcium, iron, magnesium, sodium, and potassium) and major soil constituents (aluminum) were excluded from the evaluation as per USEPA guidance (USEPA 1989, 2003).

b. From Bechtel Jacobs (1998). BSAF of 1 assumed for chemicals not addressed by Bechtel Jacobs (1998)

c. Sediment-to-benthic invertebrate uptake equation from Bechtel Jacobs (1998) used to calculate benthic invert. EPC.

| Cadmium                          | Birds          | 1.47              | Reproduction, growth, and survival | 2.37              | Reproduction        | USEPA (2005e). Geometric mean NOAEL for growth, reproduction, and survival from 49 laboratory toxicity studies. Lowest bounded LOAEL for growth, reproduction, or survival greater than geometric mean NOAEL.               |
|                                  | Mammals        | 0.77              | Growth                             | 1                 | Growth              | USEPA (2005e). Highest bounded NOAEL (0.77 mg/kg-d) for reproduction, growth, or survival less than the lowest bounded LOAEL (1.0 mg/kg-d) from 141 laboratory toxicity studies.  |
| Chromium                         | Birds          | 2.66              | Reproduction, growth, and survival | 2.78              | Survival            | USEPA (2008). Geometric mean NOAEL for growth, reproduction, and survival from 17 laboratory toxicity studies. Lowest bounded LOAEL for reproduction, growth, or survival greater than geometric mean NOAEL.                |
|                                  | Mammals        | 9.24              | Reproduction and growth            | na                | na                  | USEPA (2008). Geometric mean NOAEL for reproduction and growth from 10 studies with trivalent chromium.   |
| Cobalt                           | Birds          | 7.61              | Growth                             | 7.8               | Growth              | USEPA (2005f). Geometric mean NOAEL for growth from 10 toxicity studies. Lowest bounded LOAEL for growth or reproduction greater than geometric mean NOAEL.   |
|                                  | Mammals        | 7.33              | Reproduction and Growth            | 10.9              | Reproduction        | USEPA (2005f). Geometric mean NOAEL for reproduction and growth based on 21 laboratory toxicity studies. Lowest bounded LOAEL for growth or reproduction greater than geometric mean NOAEL.                                 |
| Copper                           | Birds          | 4.05              | Reproduction                       | 4.68              | Growth              | USEPA (2007a). Highest bounded NOAEL for reproduction, growth, or survival (4.05 mg/kg-day) lower than the lowest bounded LOAEL for reproduction, growth, or survival (4.68 mg/kg-day).                                     |
|                                  | Mammals        | 5.6               | Reproduction                       | 6.79              | Growth              | USEPA (2007a). Highest bounded NOAEL for reproduction, growth, or survival (5.6 mg/kg-day) lower than the lowest bounded LOAEL for reproduction, growth, or survival (6.79 mg/kg-day).                                      |
| Lead                             | Birds          | 1.63              | Reproduction                       | 1.94              | Reproduction        | USEPA (2005g). Highest bounded NOAEL (1.63 mg/kg-d) for growth, reproduction, or survival lower than the lowest bounded LOAEL (1.94 mg/kg-d) for growth, reproduction, or survival based on 57 laboratory toxicity studies. |
|                                  | Mammals        | 4.7               | Growth                             | 5                 | Growth              | USEPA (2005g). Highest bounded NOAEL (4.7 mg/kg-d) for growth, reproduction, or survival lower than the lowest bounded LOAEL (5 mg/kg-d) for growth, reproduction, or survival based on 220 laboratory toxicity studies.    |
| Manganese                        | Birds          | 179               | Reproduction and Growth            | 348               | Growth              | USEPA (2007b). Geometric mean NOAEL for reproduction and growth. Lowest bounded LOAEL for reproduction or growth greater than geometric mean NOAEL.   |
|                                  | Mammals        | 51.5              | Reproduction and Growth            | 65                | Growth              | USEPA (2007b). Geometric mean NOAEL for reproduction and growth. Lowest bounded LOAEL for reproduction or growth greater than geometric mean NOAEL.   |

Key:

DDT = dichlorodiphenyltrichloroethane

HPAH = high molecular weight PAH

LOAEL = lowest observed adverse effect level

LPAH = low molecular weight PAH

MEK = methyl ethyl ketone

mg/kg/day = milligrams per kilogram per day

na = no available

NOAEL = no observed adverse effect level

NYSDEC = New York State Department of Environmental Conservation

TRV = toxicity reference value

## Key:

EE-diet = estimated chemical exposure from diet

EE-soil = estimated chemical exposure from incidental soil ingestion

EE-total = total chemical exposure

EPC = exposure point concentration

HPAH = high molecular weight PAH

HQ = hazard quotient

LOAEL = lowest observed adverse effect level

LPAH = low molecular weight PAH

NOAEL = no observed adverse effect level

mg/kg = Milligrams per kilogram

mg/kg/day = Milligrams per kilogram per day

µg/kg = micrograms per kilogram

NA = Not available

Grey shading = HQ exceeds 1.0

## Note:

a = Chemicals detected in surface soil are listed. Essential nutrients (calcium, iron, magnesium, sodium, and potassium) and major soil constituents (aluminum) were excluded from the evaluation as per USEPA guidance (USEPA 1989, 2003).

b = mg/kg for metals. µg/kg for other analytes.

Table D-10. Masked Shrew Exposure Estimates and Hazard Quotients, Gorst Creek - Bremerton Auto Wrecking Landfill.

## Key:

EE-diet = estimated chemical exposure from diet

EE-soil = estimated chemical exposure from incidental soil ingestion

EE-total = total chemical exposure

EPC = exposure point concentration

HPAH = high molecular weight PAH

HQ = hazard quotient

LOAEL = lowest observed adverse effect level

LPAH = low molecular weight PAH

NOAEL = no observed adverse effect level

mg/kg = milligrams per kilogram

mg/kg/day = milligrams per kilogram per day

µg/kg = micrograms per kilogram

NA = not available

Grey shading = HQ exceeds 1.0

## Note:

a = Chemicals detected in surface soil are listed. Essential nutrients (calcium, iron, magnesium, sodium, and potassium) and major soil constituents (aluminum) were excluded from the evaluation as per USEPA guidance (USEPA 1989, 2003).

b = mg/kg for metals. µg/kg for other analytes.

Table D-11. Swallow Exposure Estimates and Hazard Quotients, Gorst Creek - Bremerton Auto Wrecking Landfill.

Notes:

a = Robin, shrew, swallow, and raccoon HQs from Tables X-9 to X-12, respectively.

b = Maximum soil concentration for robin and shrew. Maximum sediment concentration for swallow and raccoon.

Key:

ED = exposure duration (i.e. fraction of year spent at site)

EPC = exposure point concentration

HQ = hazard quotient

LOAEL = lowest observed adverse effect level

NOAEL = no observed adverse effect level

SUF = site use factor (i.e. fraction of receptor's home range represented by the site).

UCL = upper confidence limit

Table D-14. Summary of Chemicals Exceeding Screening Levels or Toxicity Reference Values, Gorst Creek - Bremerton Auto Wrecking Site.

| LPAH sum                             |   |                            |                       |       |                      |                       |       |
| Other Semivolatile Organic Compounds |   |                            |                       |       |                      |                       |       |
| Bis(2-ethylhexyl)phthalate           |   |                            |                       |       |                      |                       |       |
| Butylbenzylphthalate                 |   |                            |                       |       |                      |                       |       |

**Key:**

HPAH = high molecular weight PAH

LOAEL = Lowest observed adverse effect

LPAH = low molecular weight PAH

MEK = methyl ethyl ketone

NOAEL = No observed adverse effect level

TRV = toxicity reference value

X = screening level exceeded or HQ > 1.

X = Likely chemical of concern for wildlife (see Table X-13 and Section X.4.5.1.4) or benthos (see Section X.4.1.2).

**Notes:**

a = Chemicals detected in soil or sediment are listed.

b - Based on comparing soil chemical concentrations with soil screening levels for plants (see Table X-4).

c - Based on comparing soil chemical concentrations with soil screening levels for earthworms (see Table X-4).

d - Based on modeled exposure estimates for the American robin and masked shrew (see Tables X-9 and X-10).

e - Based on comparing chemical concentrations in sediment with sediment screening levels (see Table X-2).

f - Based on modeled exposure estimates for the barn swallow and raccoon (see Tables X-11 and X-12).

| Standard, Requirement, Criterion, or Limitation   | Citation  | Description   | ARAR/TBC  |
|---|---|---|---|
| <b>Chemical Specific</b>  |   |   |   |
| <b>Federal</b>  |   |   |   |
| Clean Water Act 40 (Federal Water Pollution Control Act; as amended)  | 33 USC §§ 1251- 1387<br>40 CFR 129  | Toxic Pollutant Effluent Standards  | Relevant and appropriate  |
| Federal Safe Drinking Water Act   | 42 USC 300f et seq.<br>40 CFR 141, 143  | Defines Maximum Contaminant Levels for drinking water   | Applicable  |
| EPA Regional Screening Levels   | EPA 2011  | Chemical-specific risk-based concentrations derived from standard risk equations for soil, groundwater, surface water, and sediment.  | To be considered  |
| Ambient Water Quality Criteria (AWQC)   | 33 USC Sec. 304;<br><a href="http://water.epa.gov/scitech/wguidance/standards/current/index.cfm">http://water.epa.gov/scitech/wguidance/standards/current/index.cfm</a> | Published pursuant to the Clean Water Act, numeric values limiting the amount of chemicals present in surface water bodies  | To be considered  |
| Ecological Soil Screening Levels  | EPA 2005a, 2005 e-g, 2007a-e  | Includes chemical-specific ecological soil screening levels   | To be considered  |
| <b>State</b>  |   |   |   |
| State of Washington ARARs Model Toxics Control Act  | RCW 70.105D Chapter 173-340 WAC   | Identifies procedures for establishing cleanup levels for groundwater, surface water, sediments, and soil   | Applicable  |
| Water quality standards for surface waters of the state of Washington   | RCW 90.48 Chapter 173-201A WAC  | Establishes water quality standards for surface waters of the state of Washington consistent with public health and public enjoyment of the waters and the propagation and protection of fish, shellfish, and wildlife                              | Applicable  |
| State Water Pollution Control Act, State Water Resources Act of 1971  | RCW 90.54 Chapter 173-200 WAC   | Establishes ground water quality standards and applies to all ground waters of the state that occur in a saturated zone or stratum beneath the surface of land or below a surface water body  | Applicable  |
| <b>Other</b>  |   |   |   |
| Ecological Soil Screening Levels  | Efroymsen et al. (1997), or Alloway (1984)  | critical soil levels and potential concern for effects for terrestrial plants.  | To be considered  |
| Ecological Sediment Screening Levels  | MacDonald et al. 2000<br>MacDonald et al. 1999  | Threshold Effect Concentrations (TECs) and Probable Effect Concentrations (PECs) Development and Evaluation of Consensus-Based Sediment Quality Guidelines for Freshwater Ecosystems  | To be considered  |
| <b>Action Specific</b>  |   |   |   |
| <b>Federal</b>  |   |   |   |
| Federal Resource Conservation and Recovery Act (RCRA)   | 42 USC 6902 et seq.<br>40 CFR 261 et seq.   | Defines hazardous waste management requirements. Applies to management of hazardous/dangerous waste. If wastes are removed from the disposal areas, they will be managed in accordance with these requirements.                                     | Relevant and appropriate (State is authorized for RCRA)   |
| Federal Endangered Species Act (1973)   | 16 USC 1531 et seq. 50 CFR 200, 402   | Establishes program to conserve and protect threatened or endangered species.   | Applicable to the site for listed and proposed to be listed threatened or endangered species and their habitat areas which will, or could, be impacted by removal action. |
| Federal Water Pollution Control Act (a.k.a. Clean Water Act), National Pollutant Discharge Elimination System (NPDES) | 33 USC Sec. 303, 304 40 CFR Part 122, 125   | Establishes State permit program for discharge of pollutants and wastewater to surface waters. Requires all known, available, and reasonable methods of treatment (AKART). Applies to discharge of extracted, treated groundwater to surface water. | Applicable for any point source discharge of pollutants to surface water, including storm water runoff at the site.   |

| Standard, Requirement, Criterion, or Limitation              | Citation   | Description   | ARAR/TBC   |
|--|--|---|--|
| Federal Water Pollution Control Act (a.k.a. Clean Water Act) | 33 USC 1251-1387 33 CFR 320-330 40 CFR 230                                     | Establishes permit program for activities performed within 200 ft. of shorelines. Applies to construction of outfall for discharge of treated groundwater to surface water.   | Applicable   |
| Toxic Substances Control Act                                 | 15 U.S.C § 2601 et seq.  | Provides requirements for reporting, record-keeping, testing, and disposal of certain chemical substances and/or mixtures, including polychlorinated biphenyls [PCB]s.  | Applicable if PCB concentrations exceed specific thresholds  |
| Clean Air Act, 42 USC s/s 7401 et seq. (1970)                | 40 CFR Parts 61 and 63   | Part 61- National Emission Standards for Hazardous Air Pollutants.<br>Part 63 - National Emission Standards for Hazardous Air Pollutants for Source Categories.   | Applicable   |
| U.S. Fish and Wildlife Coordination Act                      | 16 USC 661 et seq.   | Prohibits water pollution with any substance deleterious to fish, plant life, or bird life. Discharges to surface water controlled through state NPDES program. However, discharges to surface water may require a consultation with the United States Fish and Wildlife Service.   | Applicable if threatened or endangered species could be impacted by the response action.   |
| Migratory Bird Treaty Act (MBTA)                             | 16 USC § 703 et seq  | Makes it unlawful to “hunt, take, capture, kill” or take various other actions adversely affecting a broad range of migratory birds, including tundra swans, hawks, falcons, songbirds, without prior approval by the U.S. Fish and Wildlife Service. (See 50 CFR 10.13 for the list of birds protected under the MBTA.) Under the MBTA, permits may be issued for take (e.g., for research) or killing of migratory birds (e.g., hunting licenses). The mortality of migratory birds due to ingestion of contaminated sediment is not a permitted take under the MBTA. | Applicable for protecting migratory bird species identified. The selected removal action to be carried out in a manner that avoids the taking or killing of protected migratory bird species, including individual birds or their nests or eggs. |
| Archaeological Resources Protection Act                      | 16 USC § 470aa et seq.; 43 CFR Part 7  | Prohibits the unauthorized disturbance of archaeological resources on public or Indian lands. Archaeological resources are “any material remains of past human life and activities which are of archaeological interest,” including pottery, baskets, tools, and human skeletal remains. The unauthorized removal of archaeological resources from public or Indian lands is prohibited without a permit, and any archaeological investigations at a site must be conducted by a professional archeologist.   | Applicable for the conduct of any selected response actions that may result in ground disturbance.   |
| American Indian Religious Freedom Act                        | 42 USC § 1996 et seq   | The American Indian Religious Freedom Act and implementing regulations are intended to protect Native American religious, ceremonial, and burial sites, and the free practice of religions by Native American groups. The requirements of this Act must be followed if sacred sites graves are discovered in the course of ground-disturbing activities.  | Potentially applicable to a site where response actions involve disturbance/alteration of the ground and/or site terrain.  |
| Native American Graves Protection and Repatriation Act       | 25 USC § 3001 et seq<br>43 CFR Part 10<br><br>25 USC 3001 et seq.<br>43 CFR 10 | Intended to protect Native American graves from desecration through the removal and trafficking of human remains and “cultural items” including funerary and sacred objects. The requirements of this Act must be followed when graves are discovered or ground-disturbing activities encounter Native American burial sites.   | Potentially applicable to a site where response actions involve disturbance/alteration of the ground and/or site terrain.  |
| <b>State</b>   |  |   |  |
| Model Toxics Control Act                                     | RCW 70.105D.090<br>WAC 173-340   | Establishes administrative processes and standards to identify, investigate, and clean up facilities where hazardous substances have come to be located. Applies to any facility (including landfills) where hazardous substance releases to the environment have been confirmed. Also specifies application of cleanup levels.   | Applicable   |

| Standard, Requirement, Criterion, or Limitation                                   | Citation                      | Description  | ARAR/TBC  |
|---|-------------------------------|--|---|
| State Minimum Functional Standards for Solid Waste Handling                       | WAC 173-304                   | Defines requirements for solid waste management and disposal facilities. Applies to closure of solid waste landfill, including capping, installation of gas system, and environmental monitoring.  | Does not apply if dangerous wastes are present. |
| State Hazardous Waste Management Act (HWMA)                                       | RCW 70.105                    | Defines threshold levels and criteria to determine whether materials are hazardous/dangerous wastes. Applies to designation, handling, and disposal of wastes. Treatment residuals meeting these criteria will be handled and disposed of in accordance with regulatory requirements   | Applicable                                      |
| State Dangerous Waste Regulations   | WAC 173-303-140 WAC           | Defines pre-treatment and land disposal restrictions for certain wastes. Applies to disposal of hazardous/dangerous wastes off-site. Wastes probably will not require additional treatment or be subject to restrictions.  | Applicable if any waste is disposed off site.   |
| State Hydraulics Act  | RCW 75.20 Chapter 220-110 WAC | Establishes permit program under Dept. of Wildlife/ Fisheries for projects that may change natural flow of "waters of the state." Applies to discharge of treated groundwater to surface water (additional flow to creek is a "change").   | Applicable                                      |
| State Clean Air Act: Source Registration, Emissions Limits, Air Quality Standards | RCW 70.94 Chapter 173-400 WAC | Establishes state approved program for source registration and fee payment to restrict emissions, use of BACT, and ensures compliance with air quality standards. Applies to installing or operating source having emissions to atmosphere. Alternatives emitting contaminants to atmosphere will comply with substantive requirements of these regulations. | Applicable                                      |
| <b>Location Specific</b>  |                               |  |   |
| <b>Local</b>  |                               |  |   |
| Kitsap County Local Development Ordinances  | KCC Title 12                  | Local codes for construction activities including storm water related management. Planned construction must meet the requirements of the applicable ordinances.  | To be considered                                |
| Kitsap County Board of Health   | Ordinance 2010-1              | Adoption of the full text of WAC 173-250 by the Kitsap County Board of Health. Applies to landfills in the county. It is rules and regulations that govern the handling, storage, collection, transportation, treatment, utilization, processing and final disposal of all solid waste within Kitsap County.   | To be considered                                |

## APPENDIX F

This appendix includes the hydrologic and hydraulic calculations used in the preliminary design of the alternatives identified for evaluation under the Gorst Landfill EECA. Peak flow rates were calculated based on the Santa Barbara Urban Hydrograph Method as required by local and state design guidelines for storm water conveyance systems. Precipitation depths used to predict peak flows were estimated from spreadsheet hyetographs provided by Washington State Department of Ecology (WSDOE) under Technical Note 3. All assumptions should be noted as such in the calculations. Maps showing the estimated drainage basin and the precipitation travel routes used in the hydrologic calculations are also provided at the end of this appendix. Time of concentration calculations are based on the National Resource Conservation Service (NRCS) Technical Release 55 (TR-55) method which presents simplified procedures to calculate storm runoff volume.

## PRECIPITATION DATA

The magnitude of the precipitation depth used in the design storm is dependent upon the design step selected to meet the required design/performance goal for the project. Since there is a high downstream hazard potential and severe water quality degradation potential, a design step of 6 was selected (Design Steps range from 1 to 8). This corresponds to a 1,000,000 year storm. Procedures describes in Technical Note 3, Design Storm Construction were used to calculate the rainfall amount associated with a 1,000,000 year 24 hours storm, and a 100,000 year 6 hour storm. Rainfall amounts were multiplied by a safety factor of 15%. Documents used to perform the calculations include: (1) Dam Safety Guidelines Part IV: Dam Design and Construction; (2) Technical Note 2, Selection of Design/Performance Goals for Critical Project Elements; and (3) Technical Note 3, Design Storm Construction.

Equation 1 (from Technical Note 3)

$$X_i = X_{bar}(1 + K_i C_v)$$

|           |   |
|-----------|---|
| $X_i$     | Precipitation estimate for selected Annual Exceedance Probability (AEP)   |
| $X_{bar}$ | At site mean for duration of interest   |
| $K_i$     | Frequency factor for the KAPPA distribution for the regional value of L-skewness ( $r_3$ ) and the selected AEP |
| $C_v$     | Regional value of the coefficient of variation  |

Equation 2 (from Technical Note 3)

$$X_{bar} = [0.88 * X_{2p}] / [1 + (K_2 * C_v)]$$

|           |  |
|-----------|--|
| $X_{2p}$  | 2 year partial duration value from NOAA 2 for the duration of interest   |
| $X_{bar}$ | At site mean for duration of interest  |
| $K_2$     | Frequency factor for the 2 year event (appendix B Tables B1 and B2)  |
| $C_v$     | Regional value of the coefficient of variation for the geographic location and duration of interest (Figure 5a and 5b) |

Mean Annual Precipitation (MAP) of geographic location = 50 to 60 inches (55 inches)

| Variable  | Values<br>(24 hour) | Values (6<br>hour) | Reference   |
|-----------|---------------------|--------------------|---|
| $X_i$     | 11.27               | 4.44               | Equation 1, Tech Note 3                               |
| $X_{bar}$ | 2.78                | 1.29               | Equation 2, Tech Note 3                               |
| $K_i$     | 10.17               | 9.81               | From Appendix B, Table B1, Tech Note 3, Design Step 6 |
| $C_v$     | 0.30                | 0.25               | From Figure 5a and 5b, Tech Note 3                    |
| $X_{2p}$  | 3.00                | 1.40               | From NOAA Atlas 2                                     |
| $K_2$     | -0.17               | -0.17              | From Appendix B, Table B1, Tech Note 3                |
| $r_3$     | 0.18                | 0.18               | From Figure 6a and 6b, Tech Note 3                    |

24 hour Design Precipitation ( $P_d$ ) =  $X_i$  \* 1.15

$P_d$  12.96 inches

6 hour Design Precipitation ( $P_d$ ) =  $X_i$  \* 1.15

$P_d$  5.10 inches

### TIME OF CONCENTRATION ESTIMATE

Equations:

Overland Flow

$$T_c = (0.007 * (nL)^{0.8}) / ((P^{24} * 0.5) * (S^{0.4}))$$

max L = 300 based on NRCS TR-55 definitions

Sheet Flow

$$T_c = L / (3600 * K * S^{0.5})$$

where K = 16.13 for unpaved and 20.32 for paved

Waterway Flow

$$T_c = L / (V * 3600)$$

Using Manning's Equation the calculations show that the actual flow rate (Qa) for a 32 inch pipe installed at the site is greater than the estimated 500 year peak flow rate indicating that the selected pipe size will contain up to the 500 year peak flow rate at 85% capacity without causing backup behind the dam

Key:

- l.s. = Lump sum.
- c.f. = Cubic feet.
- c.y. = Cubic yard.
- l.f. = Linear foot.
- s.f. = Square foot.

Notes:

- [1] Some felled trees from adjacent area will be recovered and saved for erosion control in restored creek channel.
- [2] Hydraulic excavator with 1.5 c.y. bucket loading directly to trucks utilizing Level C protection.
- [3] Using 18 c.y. trucks with 50 mph average, 50 mile cycle, and 25 minute wait at disposal facility. Assumed swell factor of 1.3 for landfill waste.
- [4] Assumed as automobile wrecking waste and some municipal solid waste at 1.2 tons/cy for landfill debris.
- [5] Assumed 10% of total disposal material would be disposed of as hazardous waste. Medical waste may also be potentially encountered.
- [6] Assumed 20% of work days would be needed for haul road maintenance.
- [7] Pump/discharge system will consist of a temporary diversion dam, pumps, and piping to allow the creekflow to bypass the landfill.
- [8] Costs are based on two excavators and 30 on-road trucks with a project length of 6 months.
- [9] Volume of overburden was calculated in AutoCad utilizing July 2011 survey data.
- [10] For landfill surface repairs using 8 c.y. trucks with 15 mph average, 0.5 mile cycle. Assumed swell factor of 1.3 for soil.
- [11] For beneficial use of soil using 18 c.y. trucks with 35 mph average, 20 mile cycle, and 15 minute wait. Assumed swell factor of 1.3 for landfill waste.
- [12] Costs are based on four excavators and 30 on-road trucks with a project length of 9 months.
- [13] Costs are based on one backhoe and one truck with a project length of 3 months.
- [14] References are vendor quotes, estimates based on similar projects, or RS Means 2011 Cost Data. RS Means cost references are expressed in the format XX XX XX.XX XXXX.
